

# **CS 4644-DL / 7643-A: LECTURE 9**

## **DANFEI XU**

Topics:

- Convolutional Neural Networks Architectures

## Recap: Image features are spatially localized!

- ◆ Relevant features repeated across the image
  - ◆ Edges
  - ◆ Color
  - ◆ Motifs (corners, etc.)
- ◆ No reason to believe one feature tends to appear in a fixed location. Need to search in entire image.

Can we enforce a structure in the design of a neural network layer to reflect this?

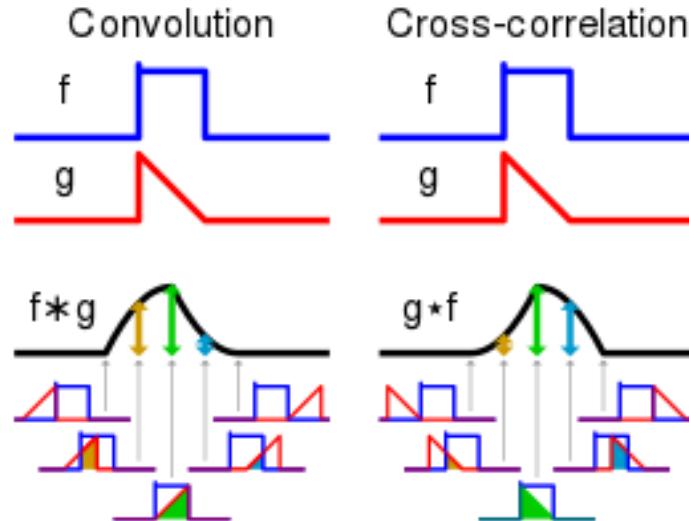

## Recap: Convolution

1-D Convolution is defined as the **integral** of the **product** of two functions after one is reflected about the y-axis and shifted.

Cross-correlation is convolution without the y-axis reflection.

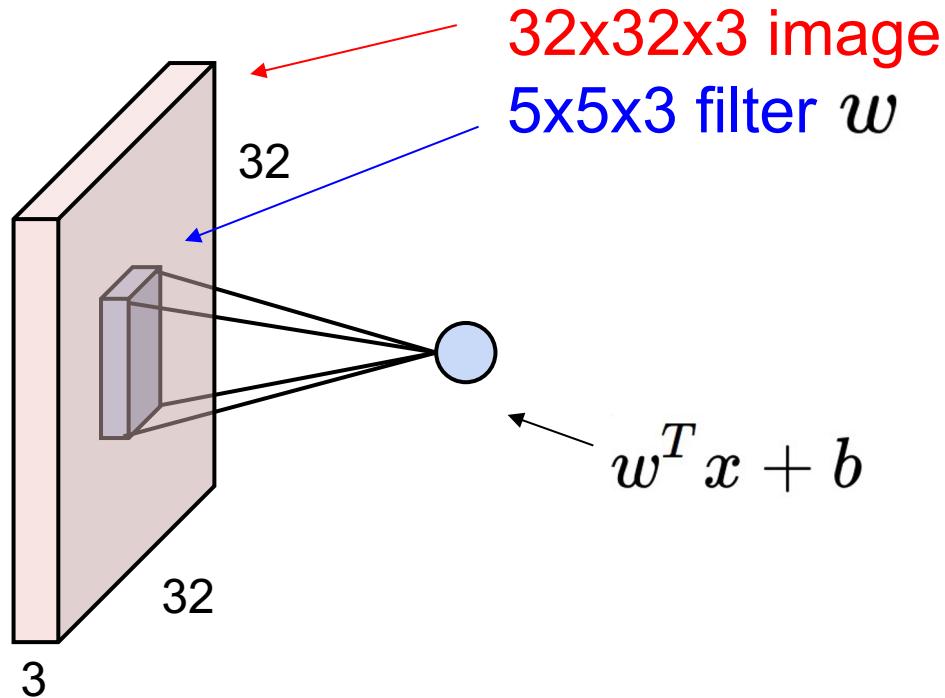

**Intuitively:** given function  $f$  and filter  $g$ . How similar is  $g(-x)$  with the part of  $f(x)$  that it's operating on.

For ConvNets, we don't flip filters, so we are really using Cross-Correlation Nets!

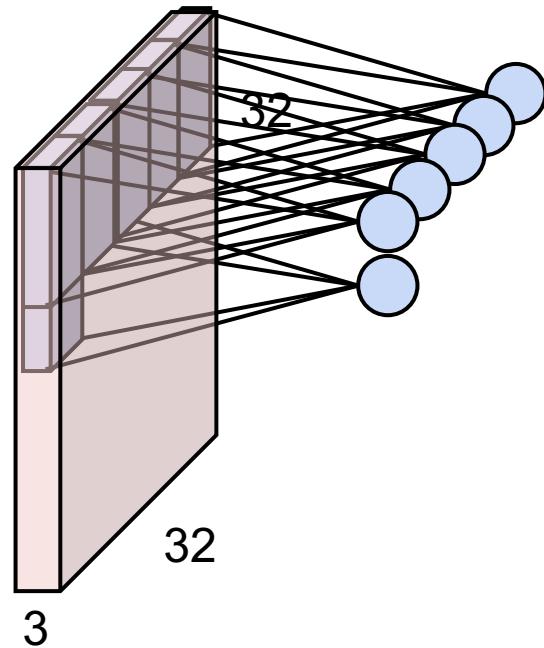

From <https://en.wikipedia.org/wiki/Convolution>

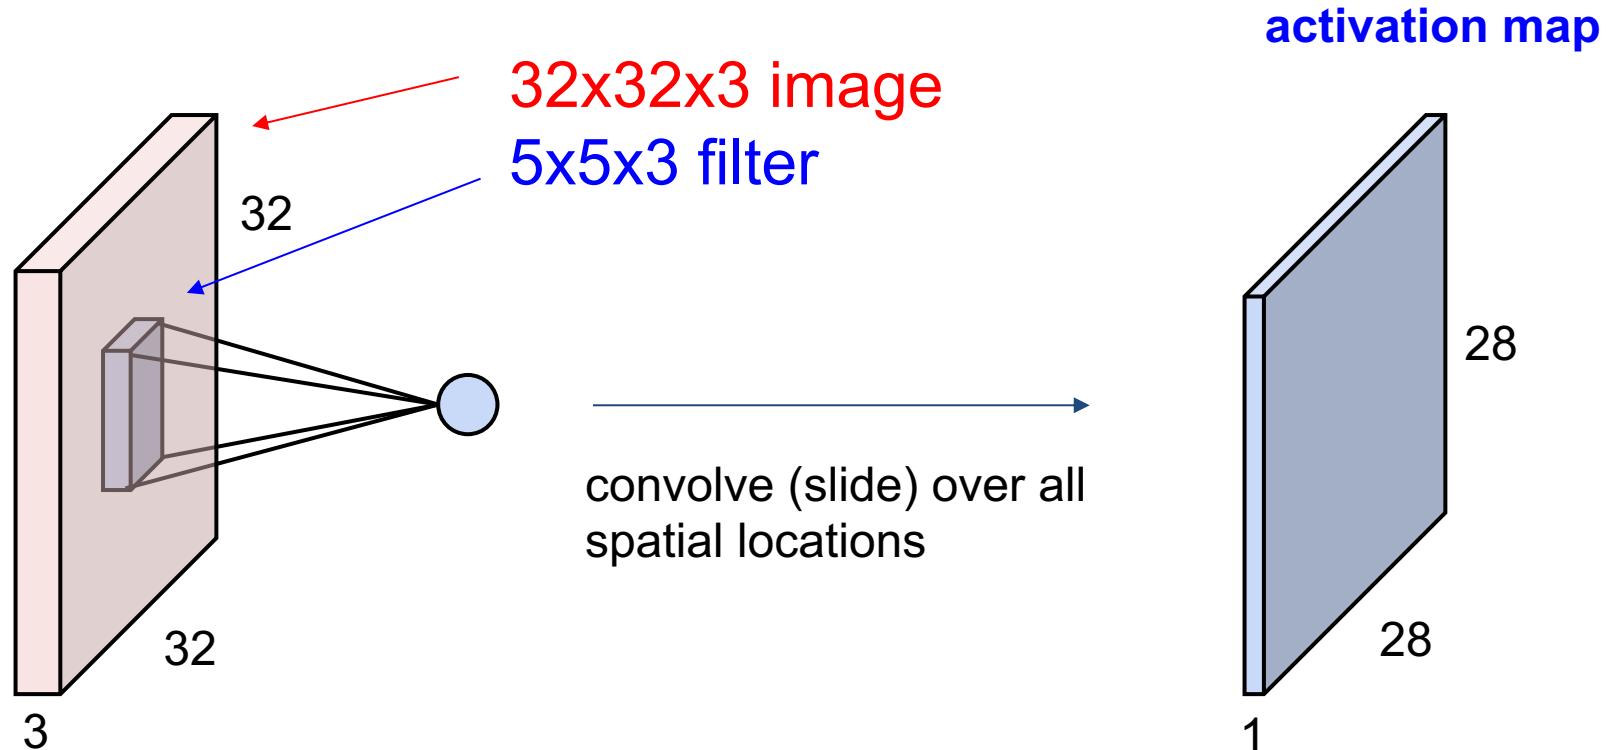

# Convolution Layer

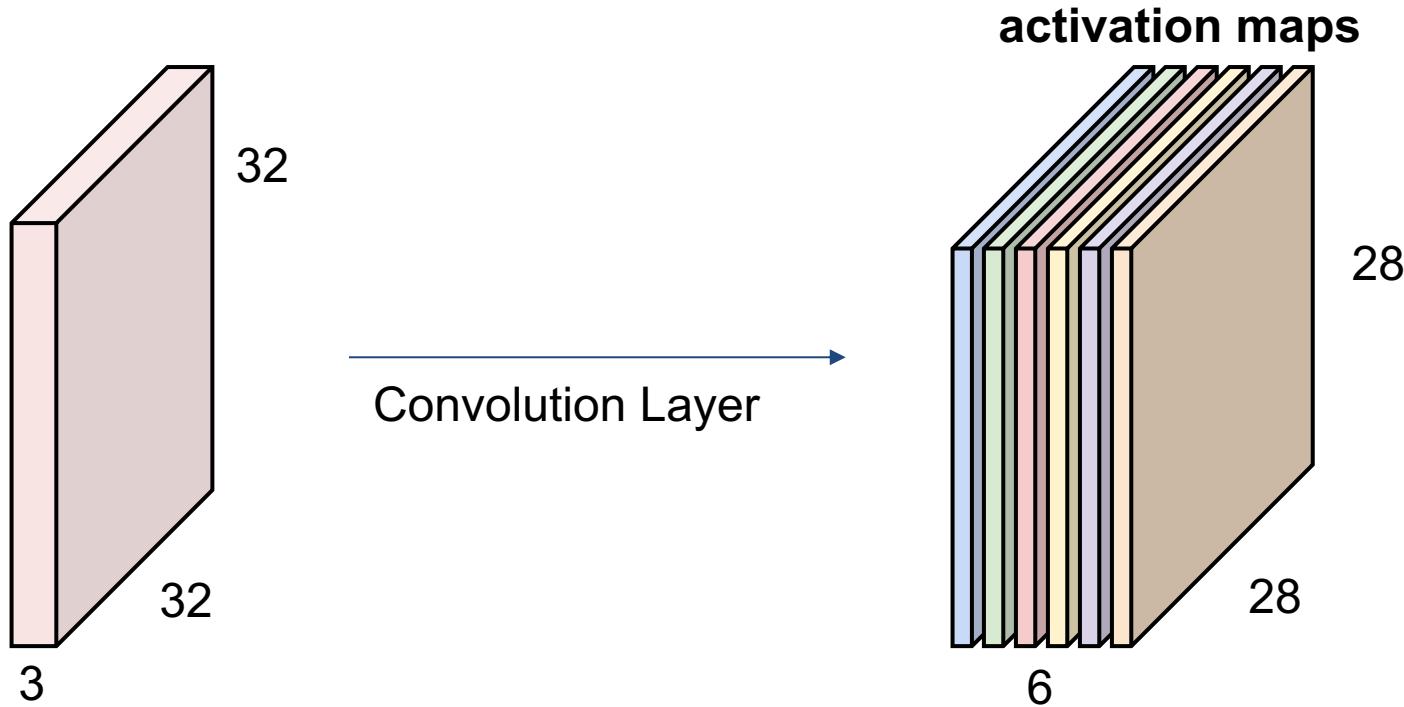

# Recap: Convolution Layer

# Recap: Convolution Layer

For example, if we had 6  $5 \times 5$  filters, we'll get 6 separate activation maps:

# In practice: Common to zero pad the border

0	0	0	0	0	0		
0							
0							
0							
0							

e.g. input 7x7

3x3 filter, applied with **stride 1**

**pad with 1 pixel border => what is the output?**

**7x7 output!**

N = input dimension

P = padding size

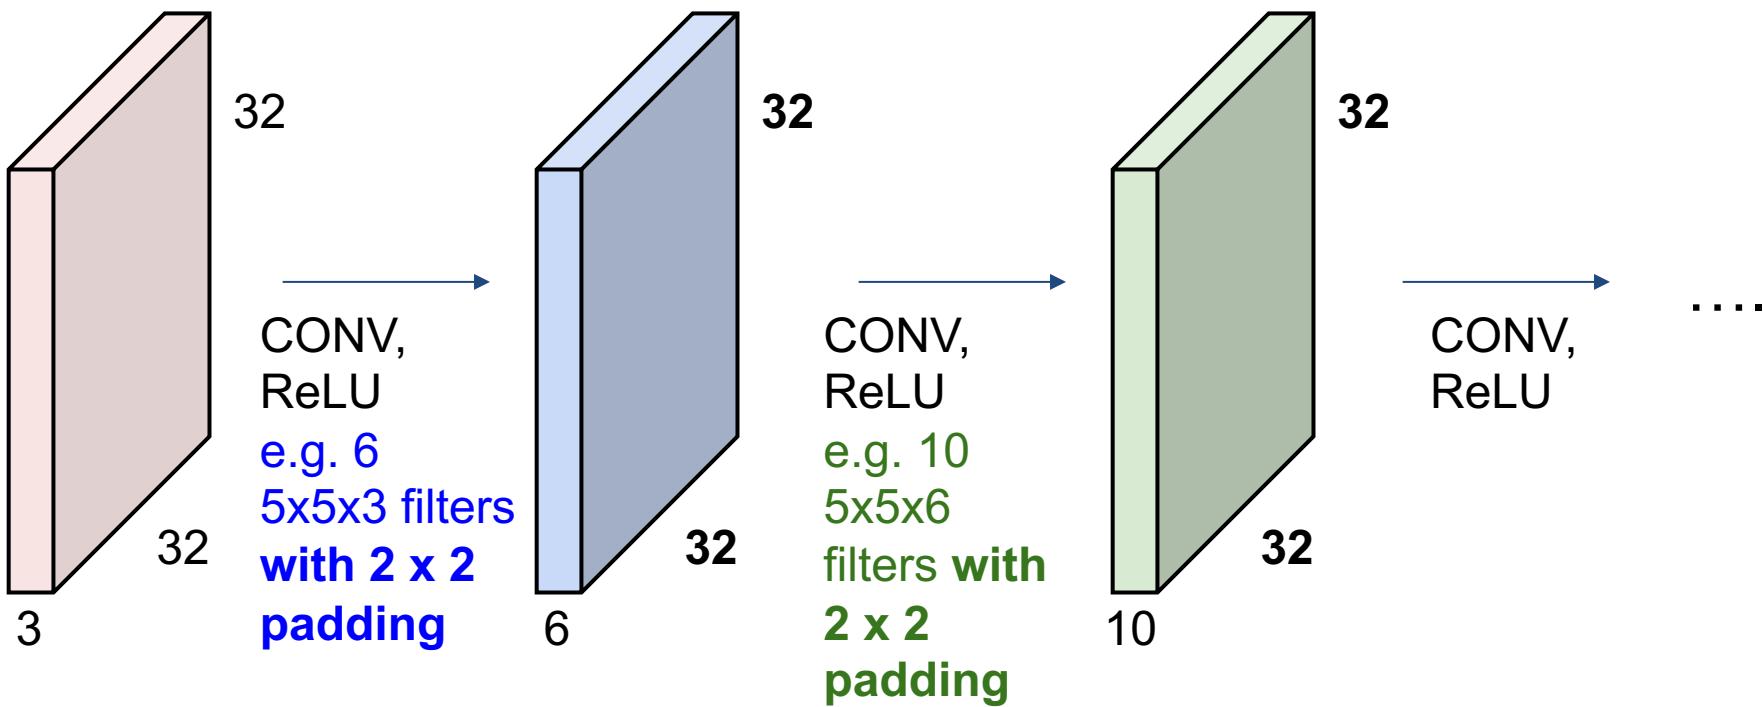

F = filter size

Output size =  $(N - F + 2P) / \text{stride} + 1$

$$= (7 - 3 + 2 * 1) / 1 + 1 = 7$$

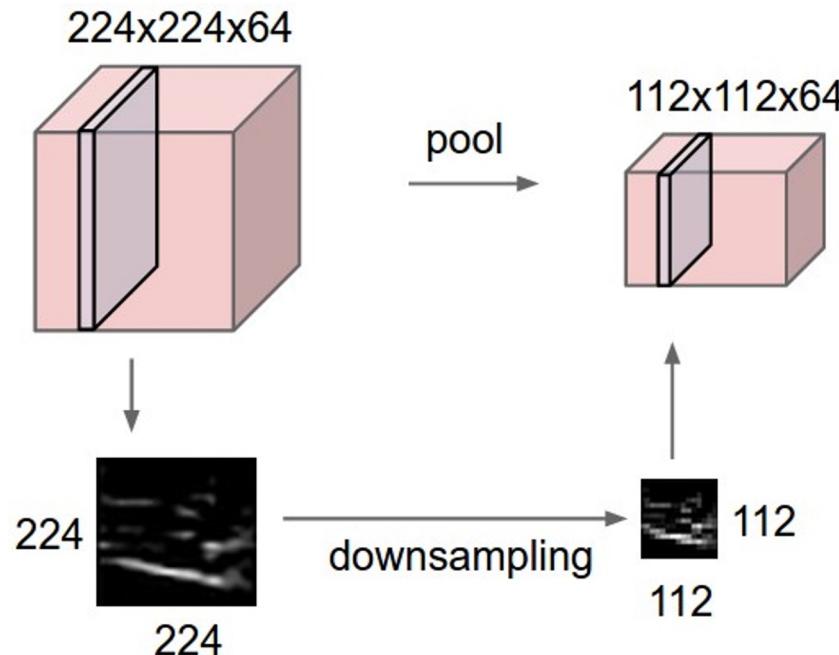

## Remember back to...

With padding, we can keep the same spatial feature dimension throughout the convolution layers.

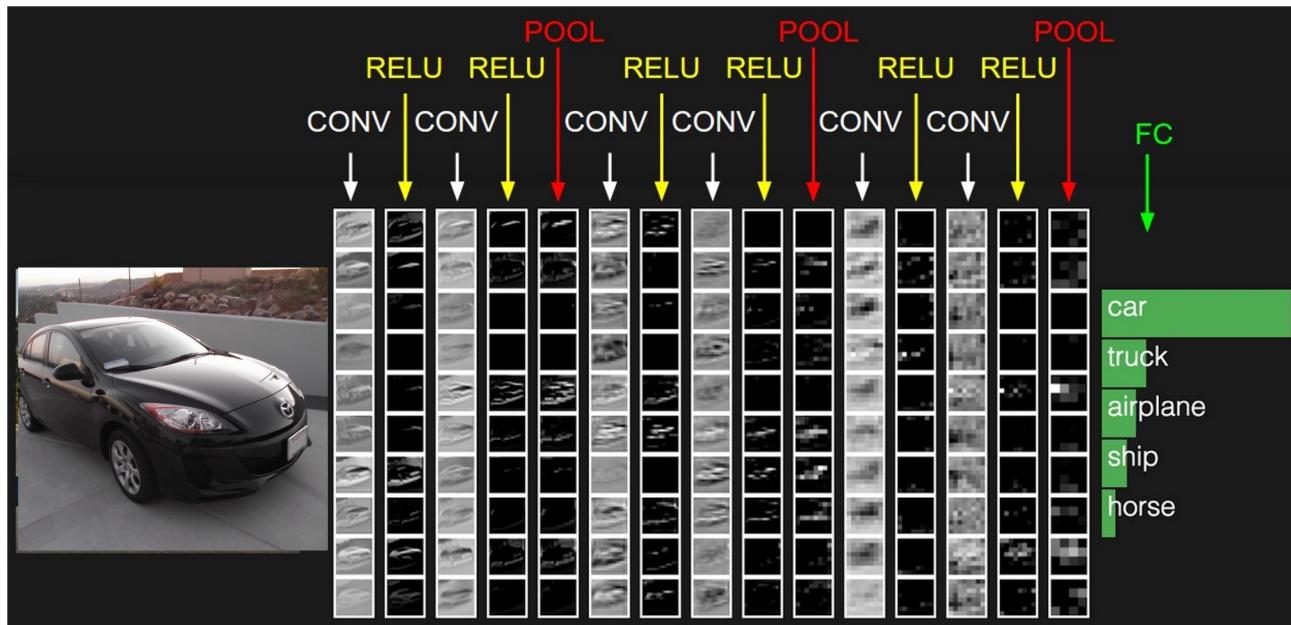

# Pooling layer (down-sampling)

- makes the representations spatially smaller
- saves computation (GPU mem & speed), allows go deeper
- operates over each activation map independently:

# A canonical (shallow) convolutional neural net

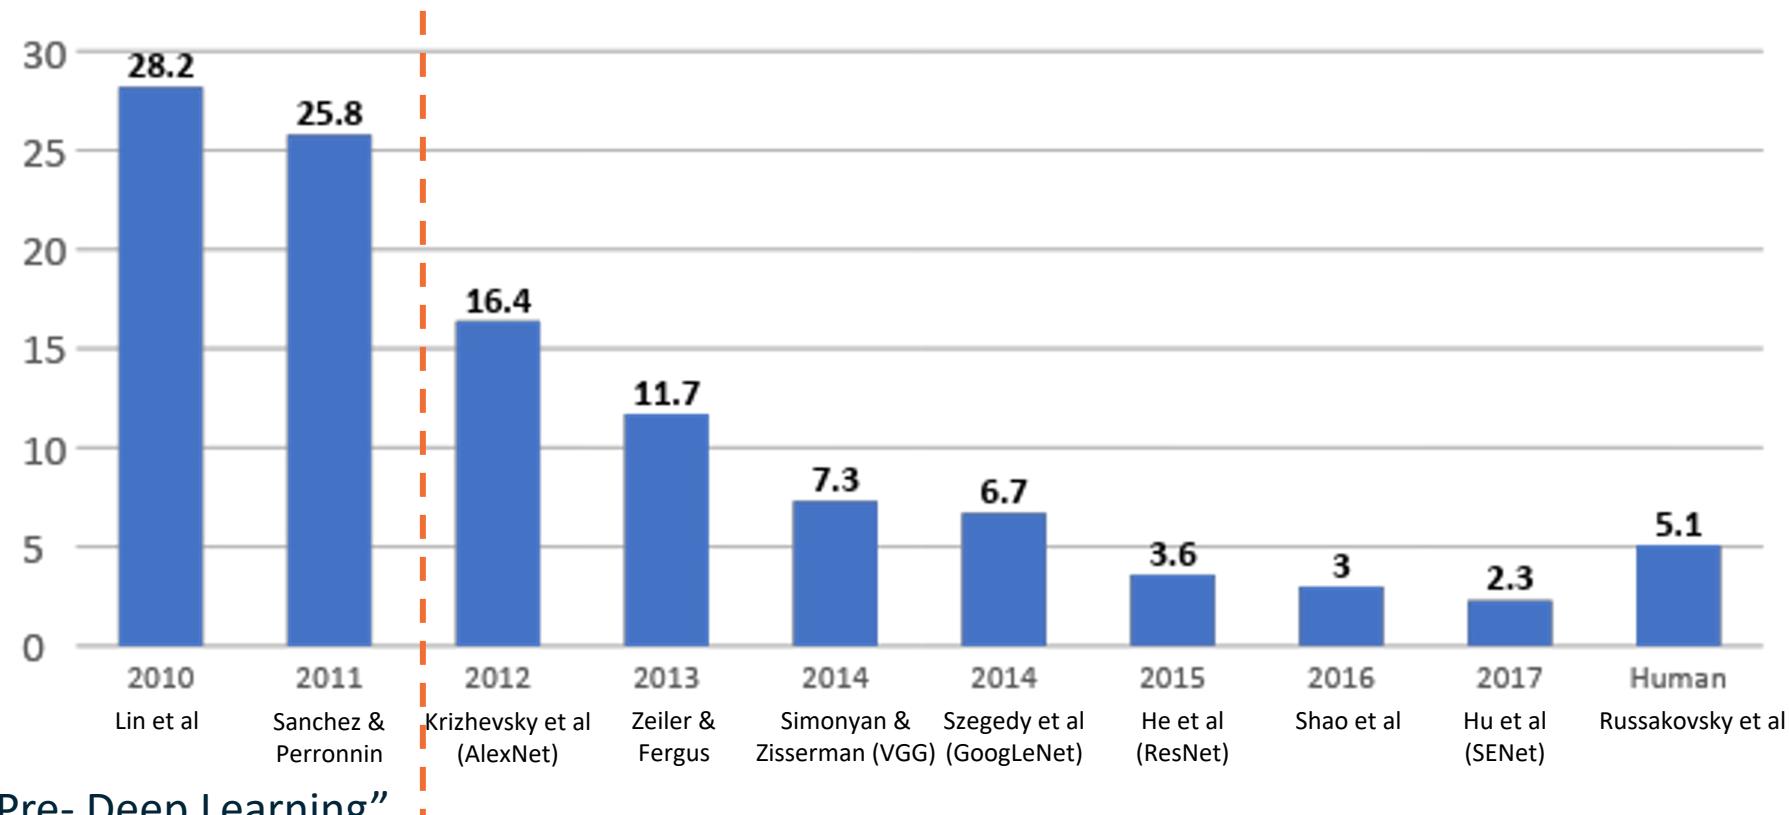

# ConvNets: Where are we today?

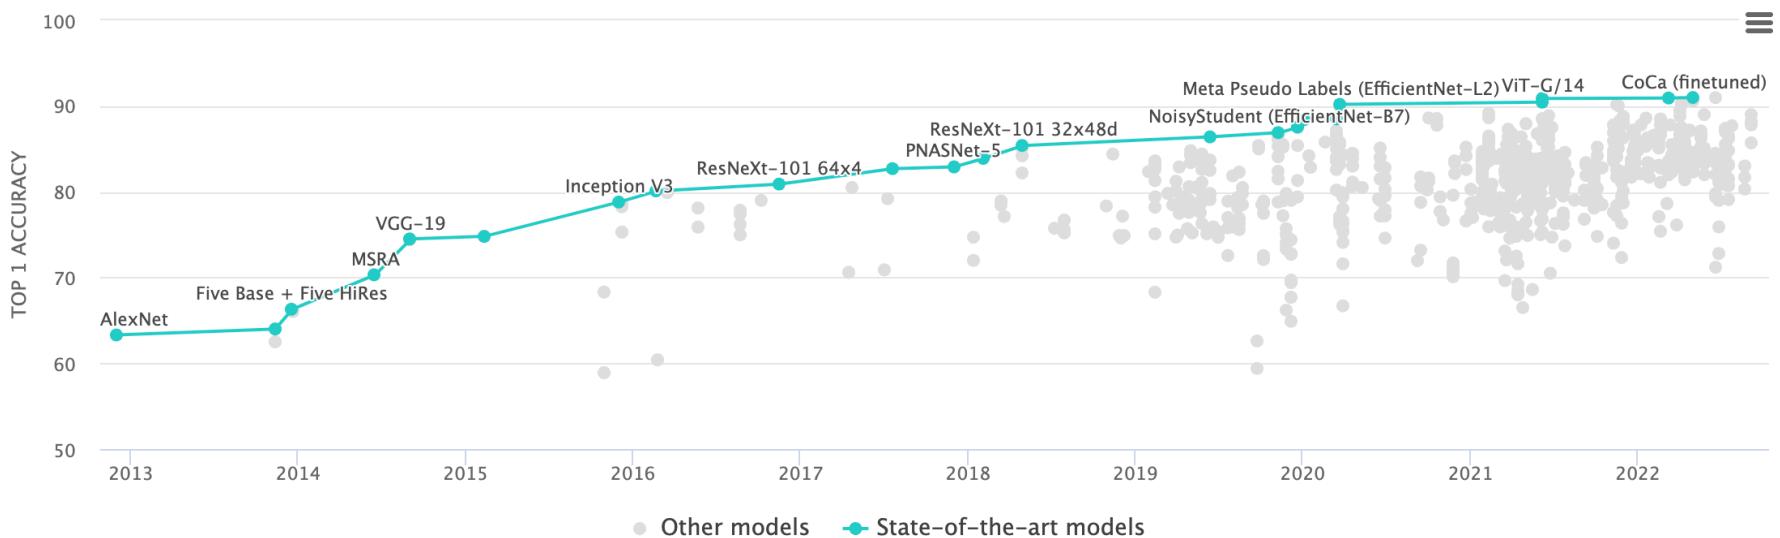

The **ImageNet** dataset contains 14,197,122 annotated images according to the WordNet hierarchy. ImageNet Large Scale Visual Recognition Challenge (ILSVRC) is a benchmark for image classification and object detection based on the dataset.

has same **effective receptive field** as  
one 7x7 conv layer

But deeper, more non-linearities

And fewer parameters:  $3 * (3^2 C^2)$  vs.  
 $7^2 C^2$  for  $C$  channels per layer

AlexNet

VGG16

VGG19

# Case Study: VGGNet

[Simonyan and Zisserman, 2014]

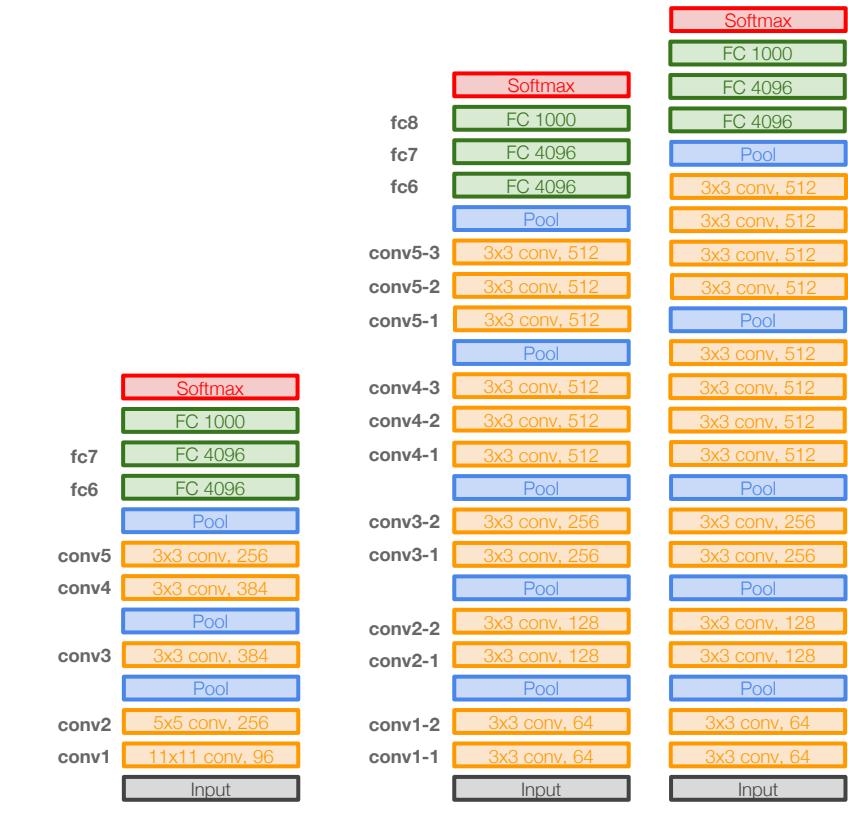

## Details:

- ILSVRC'14 2nd in classification, 1st in localization
- Similar training procedure as Krizhevsky 2012
- No Local Response Normalisation (LRN)
- Use VGG16 or VGG19 (VGG19 only slightly better, more memory)
- Use ensembles for best results
- FC7 features generalize well to other tasks

**Still very expensive!**

TOTAL memory:  $24M * 4 \text{ bytes} \approx 96\text{MB} / \text{image}$   
(only forward!  $\sim *2$  for bwd)

TOTAL params: 138M parameters

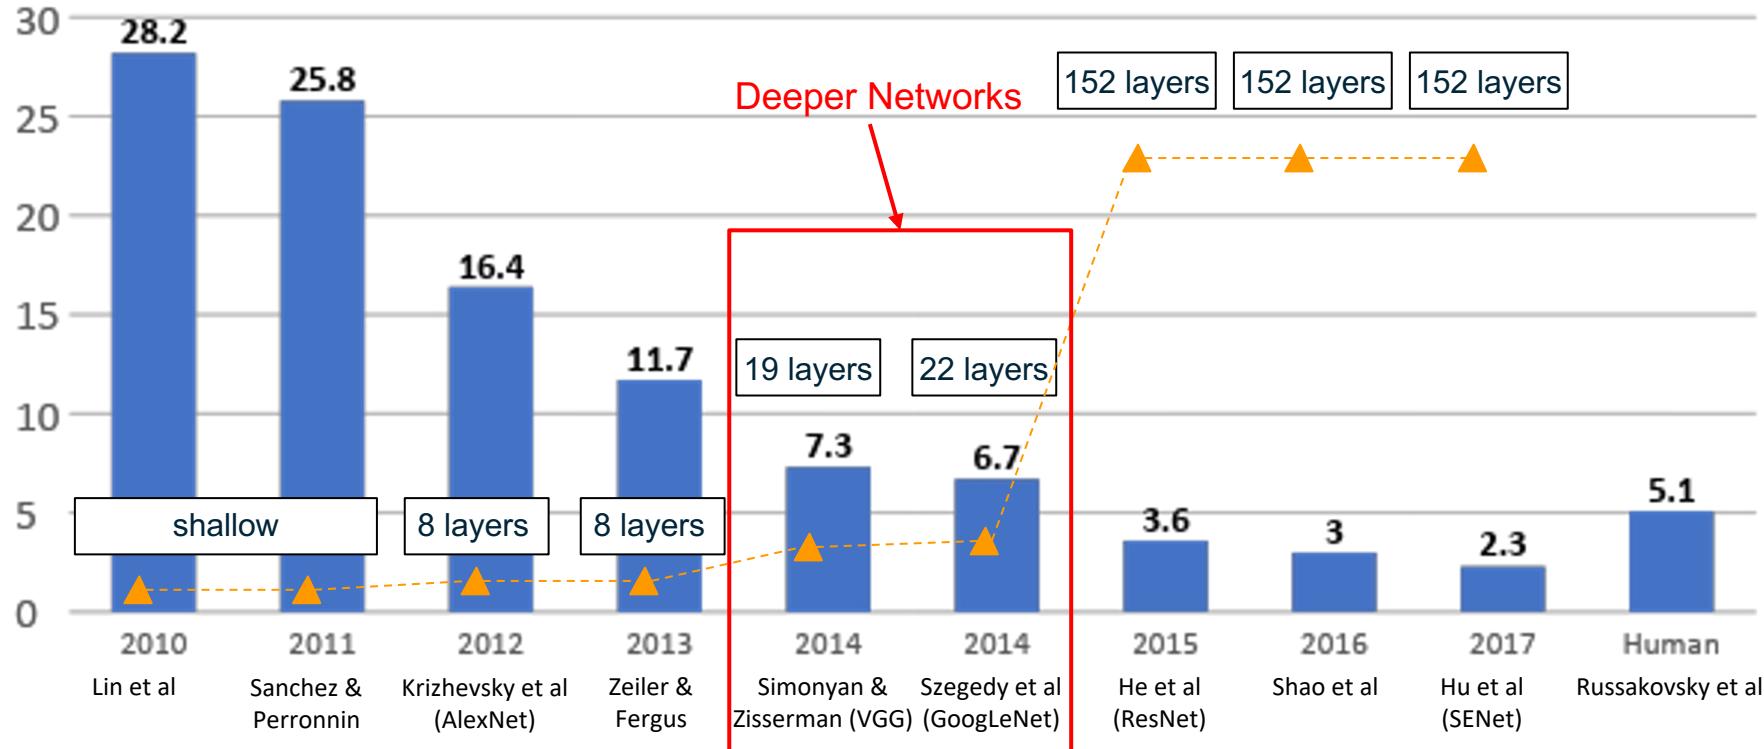

AlexNet

VGG16

VGG19

# ImageNet Large Scale Visual Recognition Challenge (ILSVRC) winners

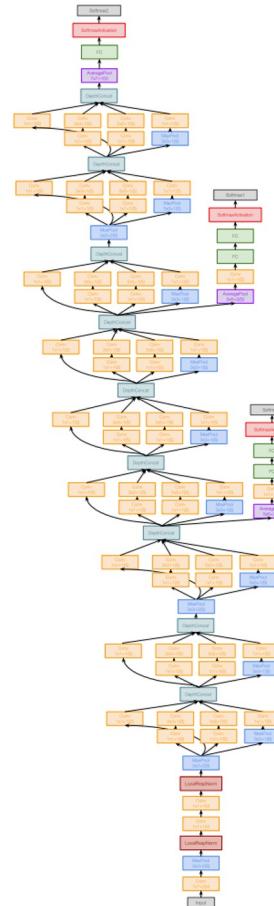

# Case Study: GoogLeNet

[Szegedy et al., 2014]

Deeper networks, focus on computational efficiency

- ILSVRC'14 classification winner (6.7% top 5 error)
- 22 layers
- Only 5 million parameters!  
12x less than AlexNet  
27x less than VGG-16
- Efficient “Inception” module
- No FC layers

# Case Study: GoogLeNet

[Szegedy et al., 2014]

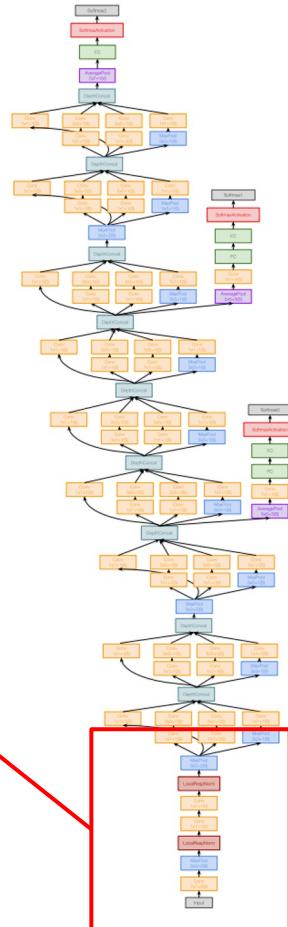

Deeper networks, focus on computational efficiency

- ILSVRC'14 classification winner (6.7% top 5 error)
- 22 layers
- Only 5 million parameters! 12x less than AlexNet  
27x less than VGG-16
- Efficient “Inception” module
- No FC layers

**Stem Network:** aggressively reduce the input feature volume

- Conv  $7 \times 7 \times 64$  with stride 2
- MaxPool
- Conv  $1 \times 1 \times 64$
- Conv  $3 \times 3 \times 192$
- MaxPool

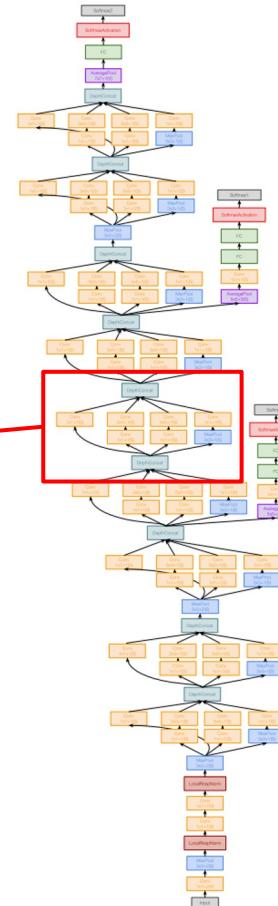

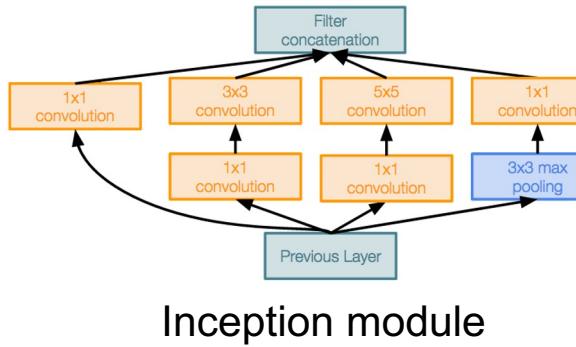

Reduce  $224 \times 224$  spatial solution to  $28 \times 28$  with just 418 MFLOP!  
(Comparing to 7485 MFLOP of VGG)

# Case Study: GoogLeNet

[Szegedy et al., 2014]

“Inception module”: design a good local network topology (network within a network) and then stack these modules on top of each other

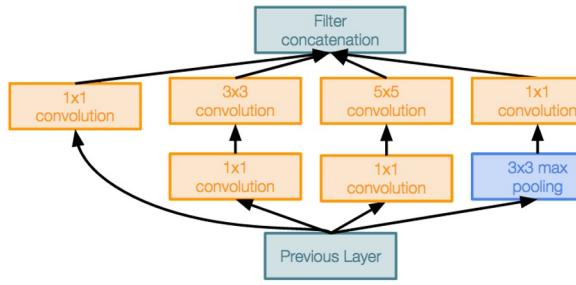

# Case Study: GoogLeNet

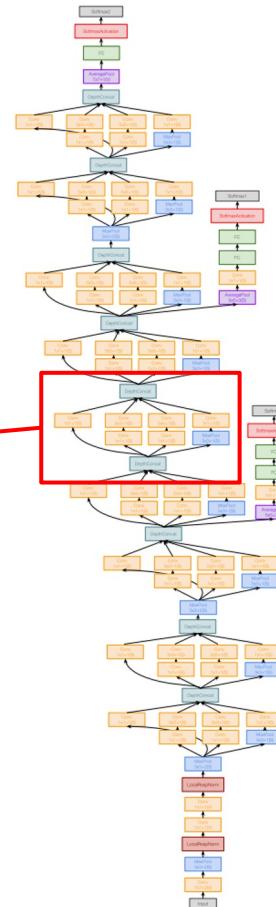

[Szegedy et al., 2014]

“Inception module”: design a good local network topology (network within a network) and then stack these modules on top of each other

Multiple conv filter size diversifies learned features

Full GoogLeNet  
architecture

Classifier output

# Case Study: GoogLeNet

[Szegedy et al., 2014]

Full GoogLeNet  
architecture

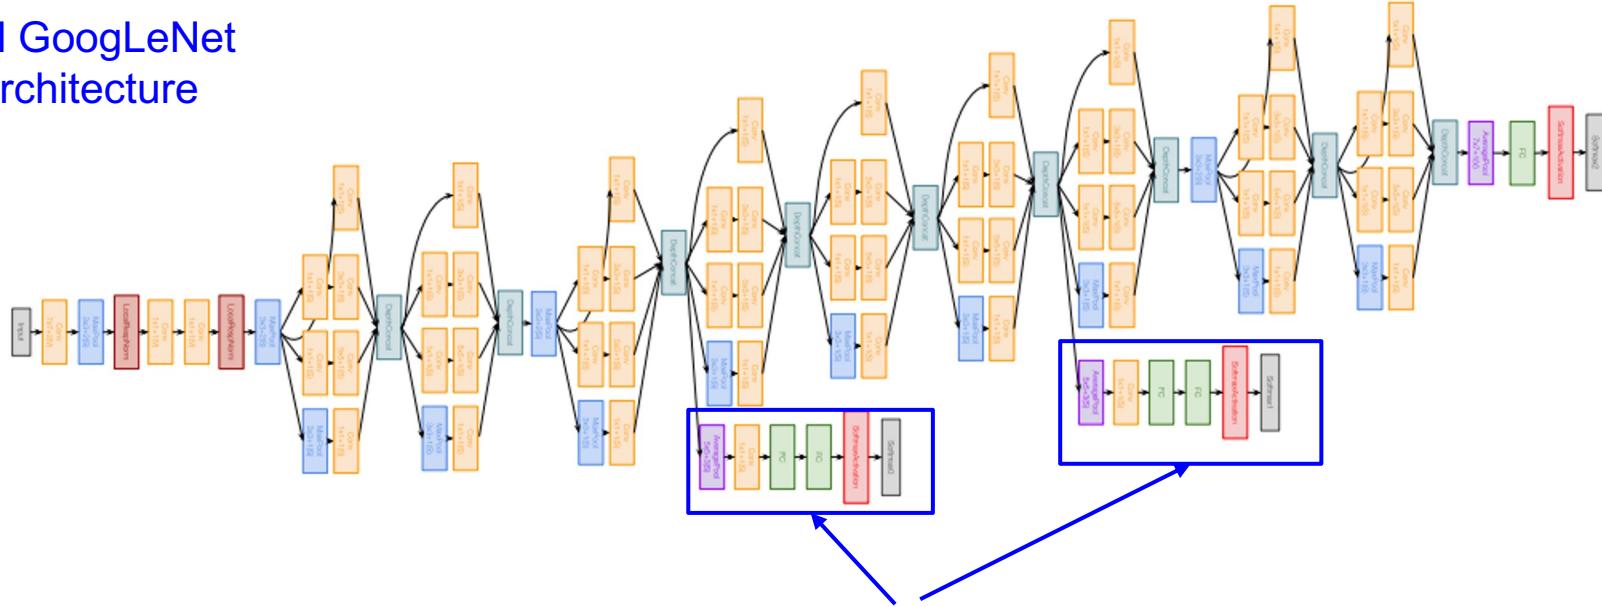

Note: after the last convolutional layer, a global average pooling layer is used that **spatially** averages across each feature map, before final FC layer. No longer multiple expensive FC layers!  
(Also used in ResNet)

Classifier output

# Case Study: GoogLeNet

[Szegedy et al., 2014]

Full GoogLeNet  
architecture

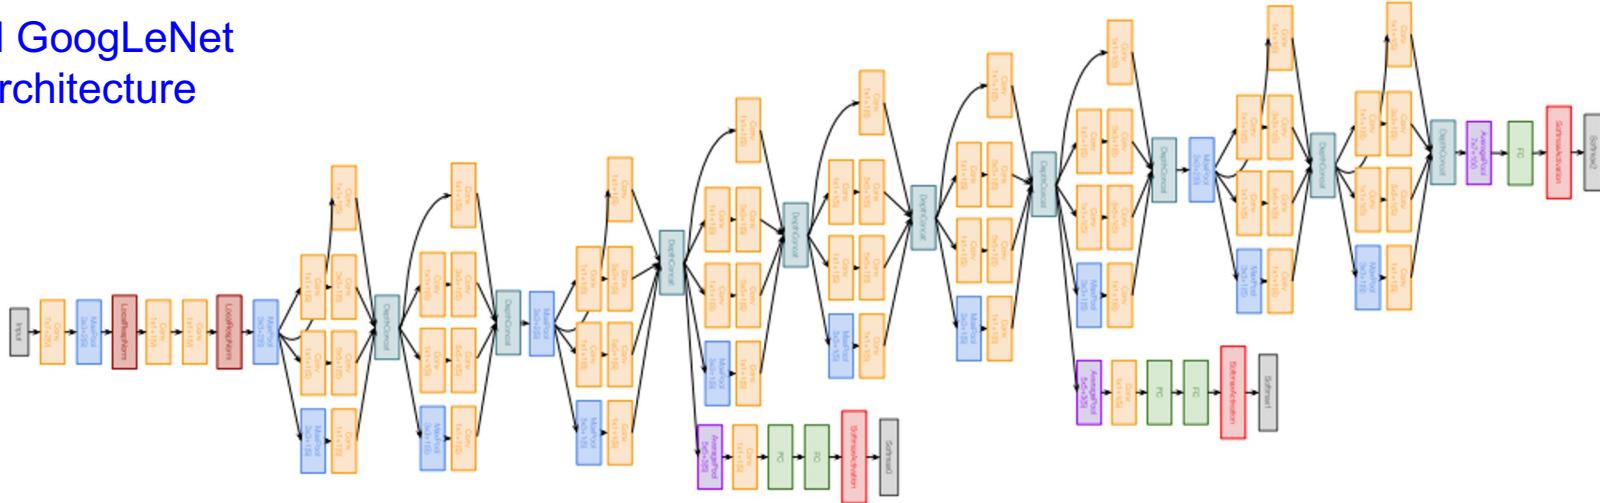

Auxiliary classification outputs to inject additional gradient at lower layers (AvgPool-  
1x1Conv-FC-Softmax)

Related to **vanishing gradient**, will discuss further in Lecture 10

# Case Study: GoogLeNet

[Szegedy et al., 2014]

Full GoogLeNet  
architecture

22 total layers with weights

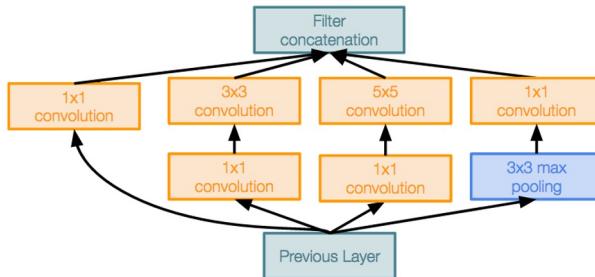

(parallel layers count as 1 layer => 2 layers per Inception module. Don't count auxiliary output layers)

# Case Study: GoogLeNet

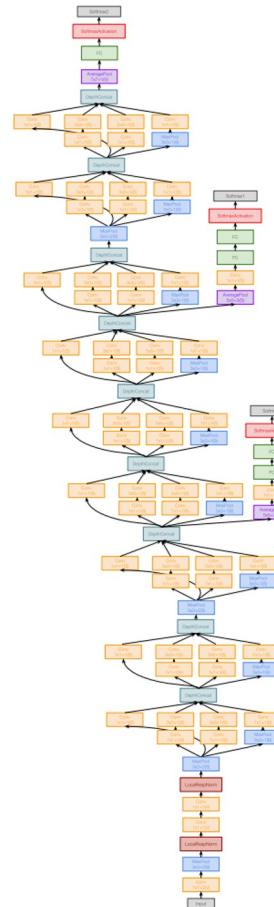

[Szegedy et al., 2014]

Deeper networks, with computational efficiency

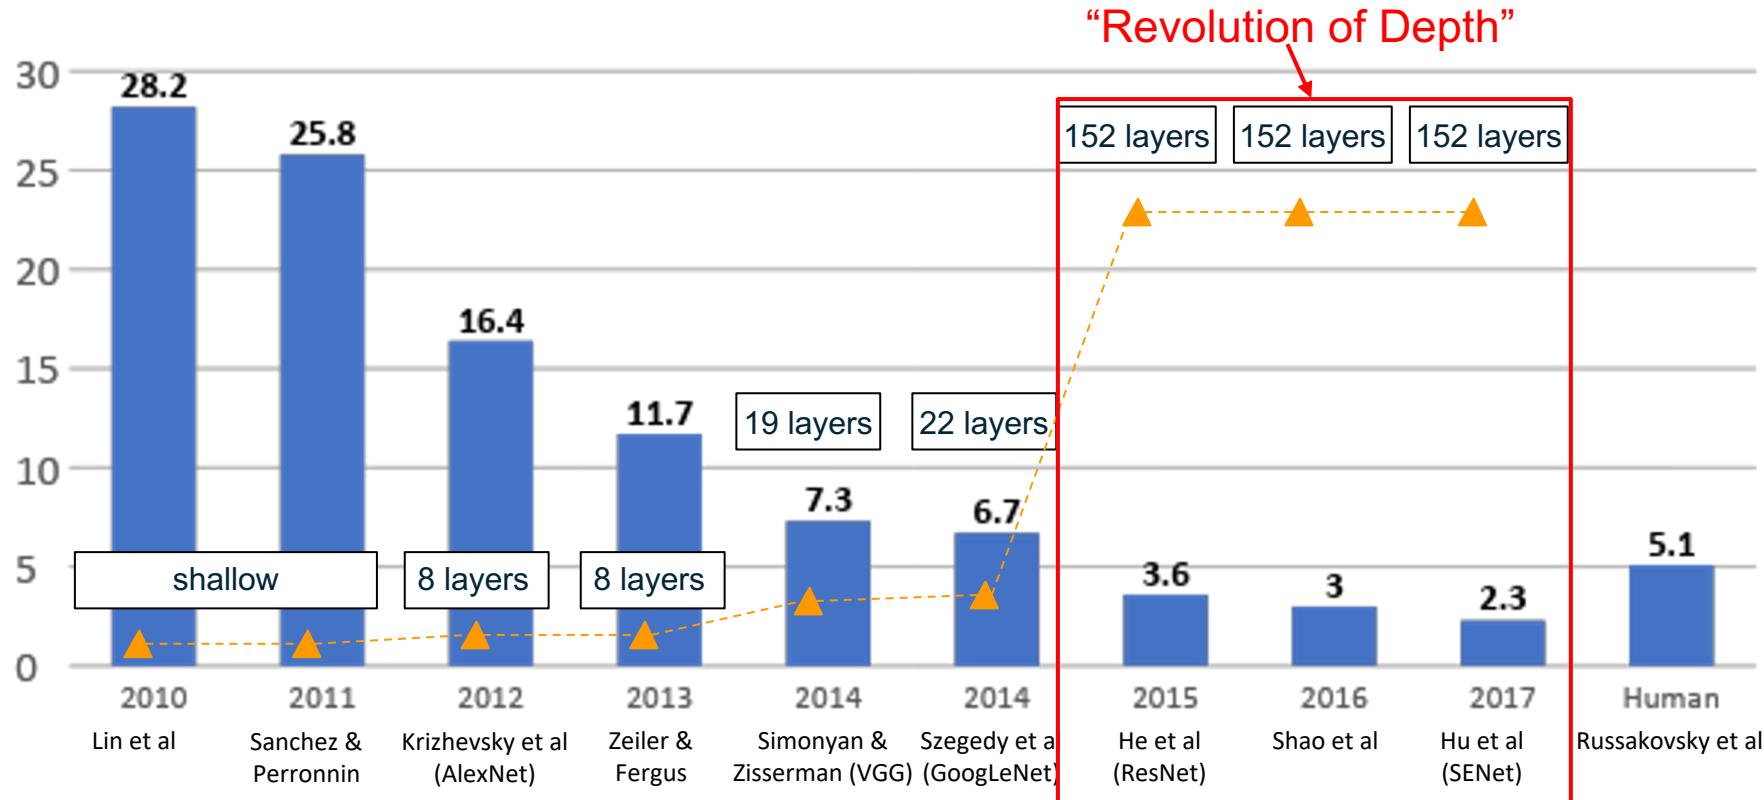

- 22 layers
- Efficient “Inception” module
- Avoids expensive FC layers
- 12x less params than AlexNet
- 27x less params than VGG-16
- ILSVRC’14 classification winner (6.7% top 5 error)

Inception module

# ImageNet Large Scale Visual Recognition Challenge (ILSVRC) winners

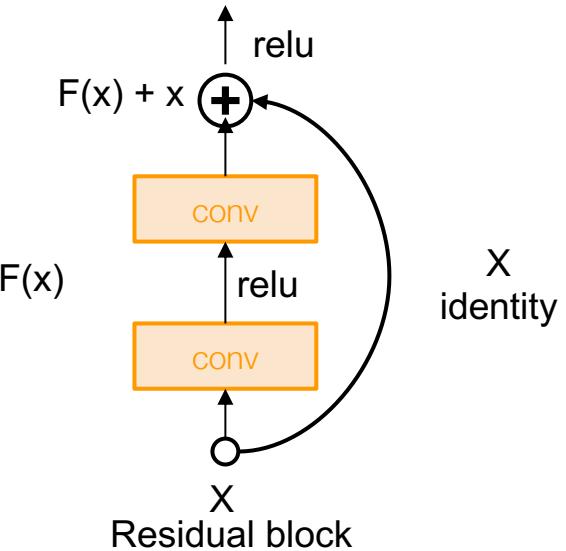

# Case Study: ResNet

[He et al., 2015]

Very deep networks using residual connections

- 152-layer model for ImageNet
- ILSVRC'15 classification winner (3.57% top 5 error)
- Swept all classification and detection competitions in ILSVRC'15 and COCO'15!

# Case Study: ResNet

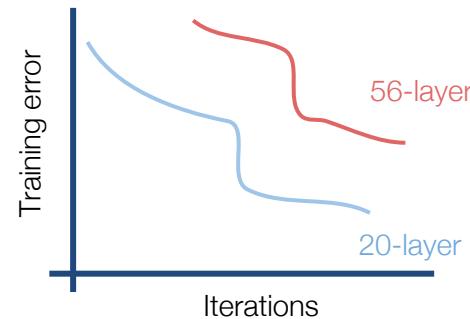

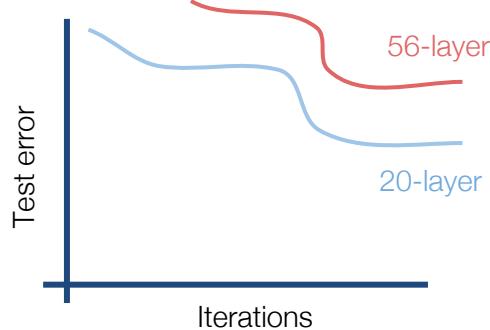

[He et al., 2015]

What happens when we continue stacking deeper layers on a “plain” convolutional neural network?

# Case Study: ResNet

[He et al., 2015]

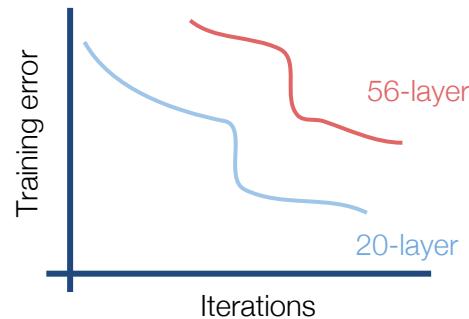

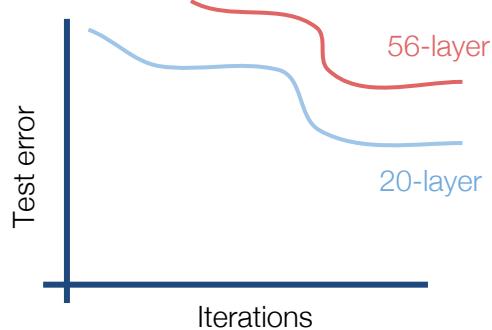

What happens when we continue stacking deeper layers on a “plain” convolutional neural network?

# Case Study: ResNet

[He et al., 2015]

What happens when we continue stacking deeper layers on a “plain” convolutional neural network?

56-layer model performs worse on both test and training error  
-> The deeper model performs worse, but it's not caused by overfitting!

# Case Study: ResNet

[He et al., 2015]

Fact: Deep models have more representation power  
(more parameters) than shallower models.

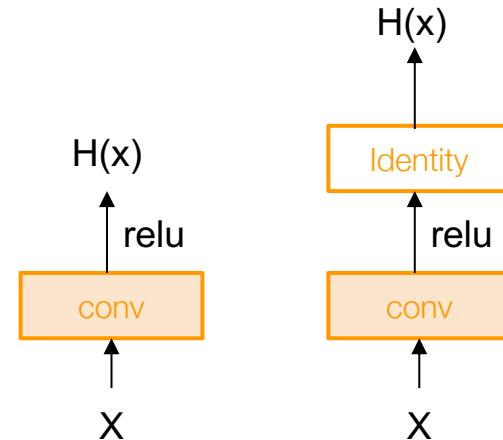

Hypothesis: the problem is an *optimization* problem,  
**deeper models are harder to optimize**

# Case Study: ResNet

[He et al., 2015]

A deeper model can **emulate** a shallower model: copy layers from shallower model, set extra layers to identity

Thus deeper models should do at least as good as shallow models

# Case Study: ResNet

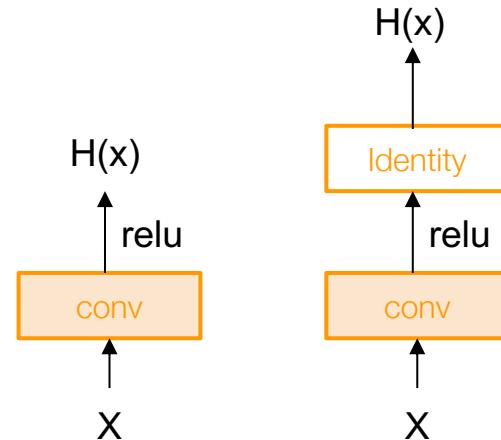

[He et al., 2015]

A deeper model can **emulate** a shallower model: copy layers from shallower model, set extra layers to identity

Thus deeper models should do at least as good as shallow models

Deeper models are harder to optimize. They don't learn identity functions to emulate shallow models

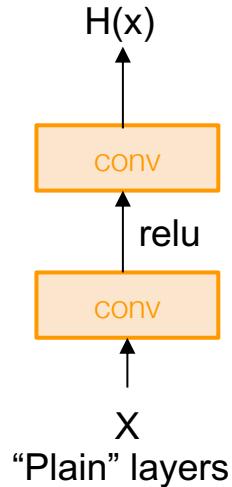

**Solution:** Change the network so learning identity functions as extra layers is easy

# Case Study: ResNet

[He et al., 2015]

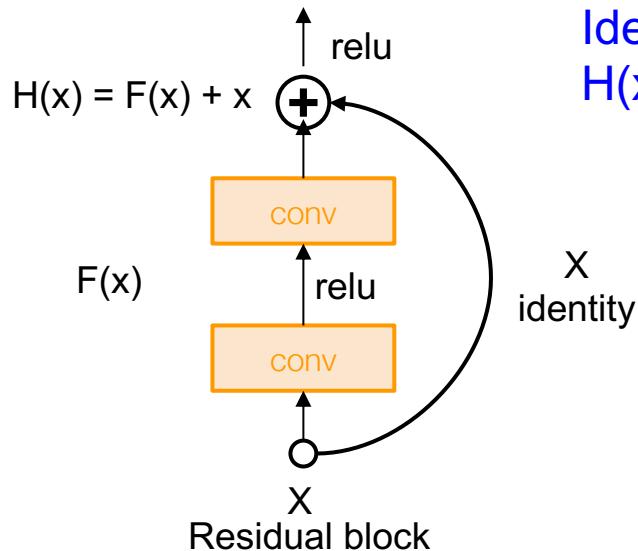

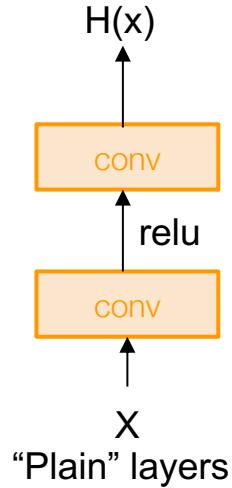

Solution: Change the network so learning identity functions as extra layers is easy

# Case Study: ResNet

[He et al., 2015]

Solution: Change the network so learning identity functions as extra layers is easy

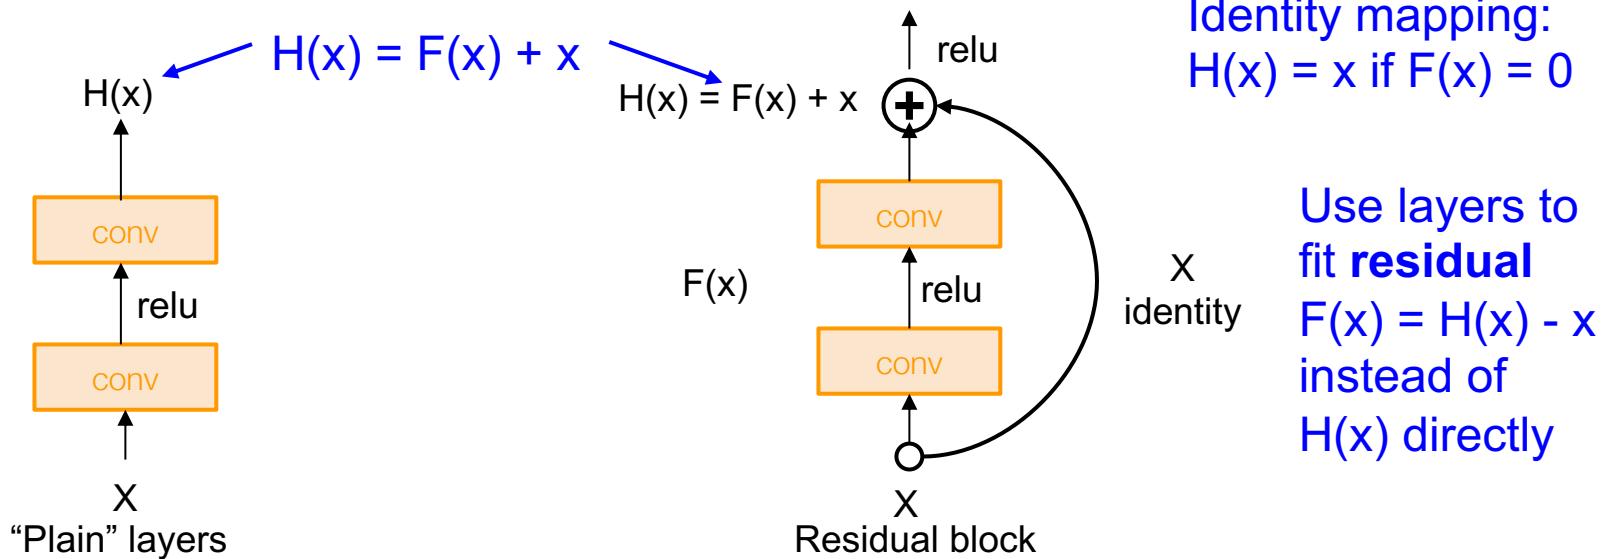

Identity mapping:  
 $H(x) = x$  if  $F(x) = 0$

$X$   
identity

# Case Study: ResNet

[He et al., 2015]

Solution: Change the network so learning identity functions as extra layers is easy

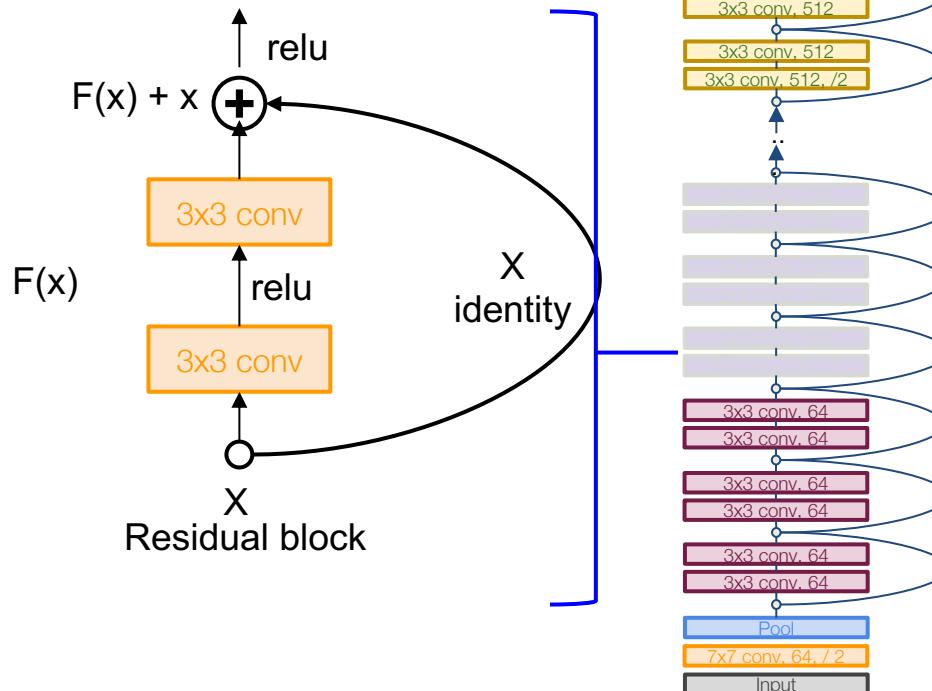

# Case Study: ResNet

[He et al., 2015]

Full ResNet architecture:

- Stack residual blocks
- Every residual block has two 3x3 conv layers

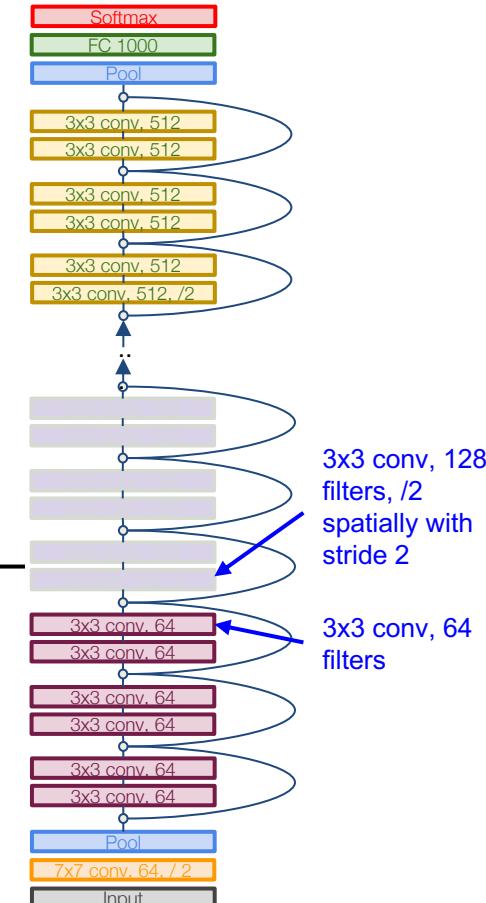

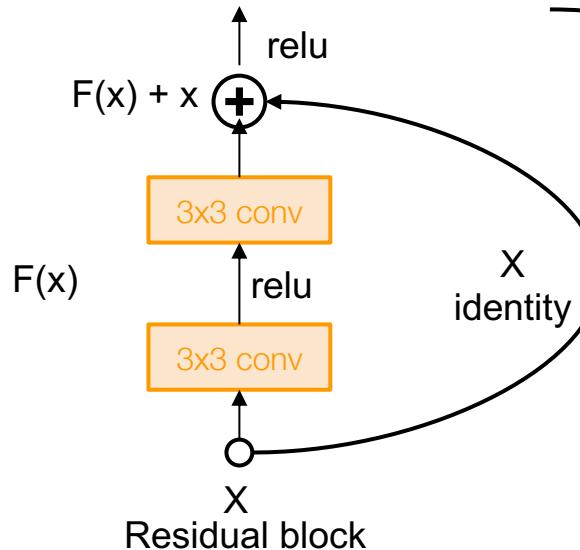

# Case Study: ResNet

[He et al., 2015]

Full ResNet architecture:

- Stack residual blocks
- Every residual block has two 3x3 conv layers
- Periodically, double # of filters and downsample spatially using stride 2 (/2 in each dimension)  
Reduce the activation volume by half.

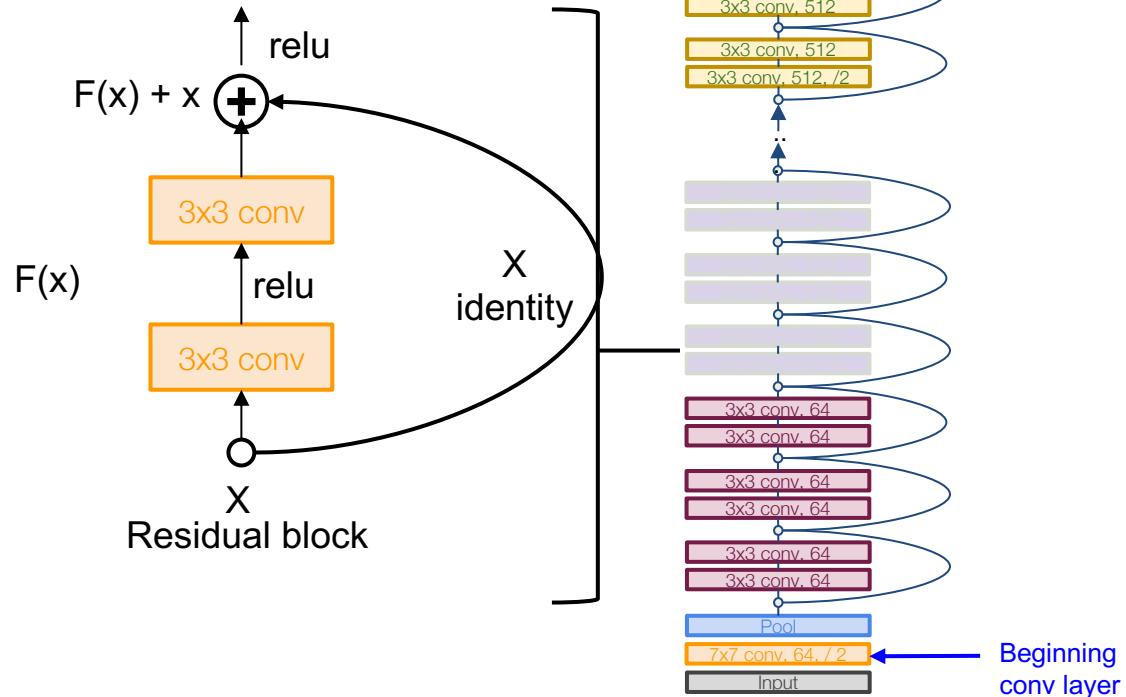

# Case Study: ResNet

[He et al., 2015]

Full ResNet architecture:

- Stack residual blocks
- Every residual block has two 3x3 conv layers
- Periodically, double # of filters and downsample spatially using stride 2 (/2 in each dimension)
- Additional conv layer at the beginning (stem)

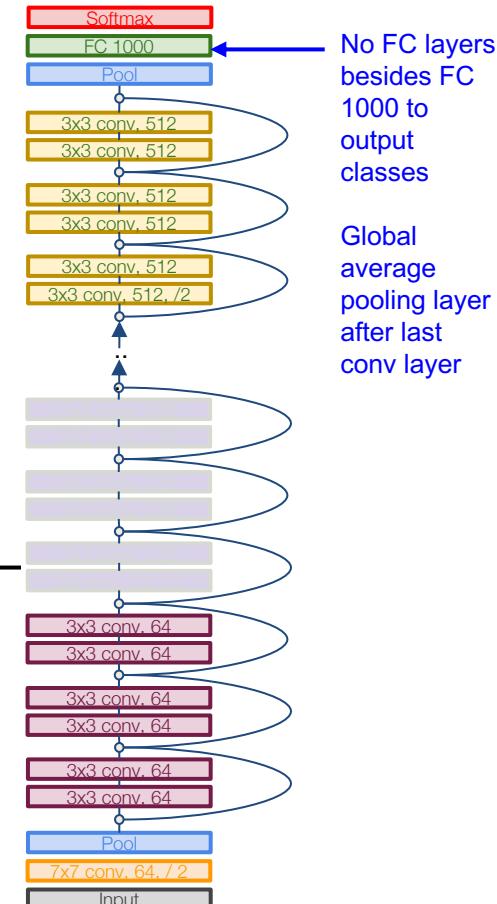

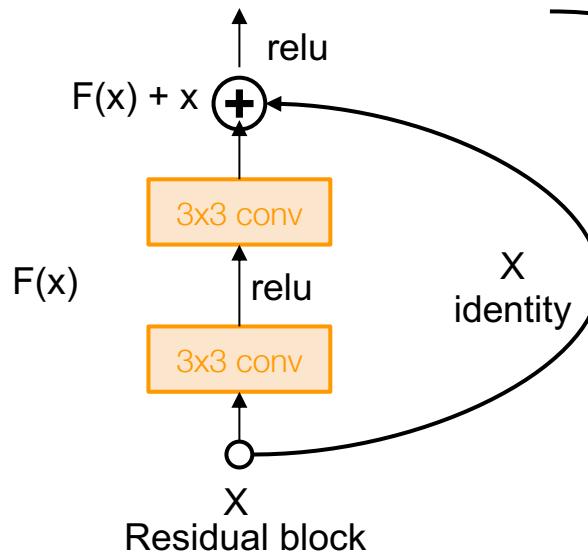

# Case Study: ResNet

[He et al., 2015]

Full ResNet architecture:

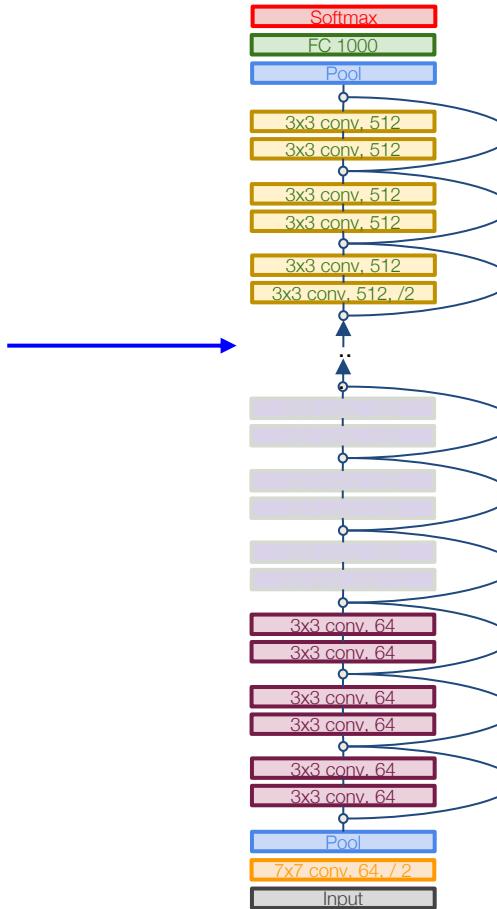

- Stack residual blocks
- Every residual block has two 3x3 conv layers
- Periodically, double # of filters and downsample spatially using stride 2 (/2 in each dimension)
- Additional conv layer at the beginning (stem)
- No FC layers at the end (only FC 1000 to output classes)
- (In theory, you can train a ResNet with input image of variable sizes)

# Case Study: ResNet

[He et al., 2015]

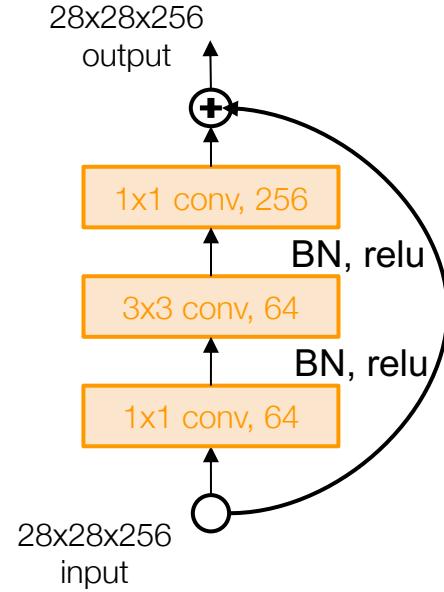

Total depths of 18, 34, 50,  
101, or 152 layers for  
ImageNet

# Case Study: ResNet

[He et al., 2015]

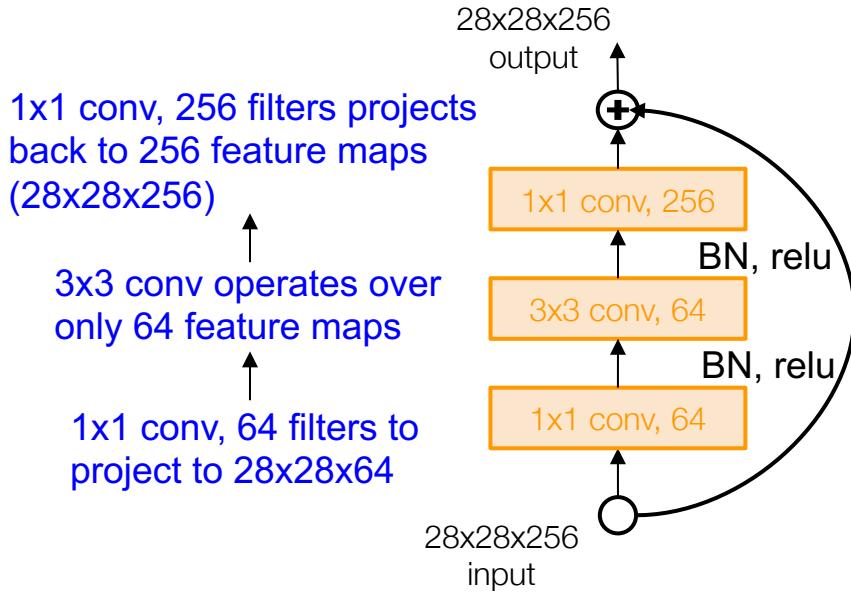

For deeper networks (ResNet-50+), use “bottleneck” layer to improve efficiency (similar to GoogLeNet)

# Case Study: ResNet

[He et al., 2015]

For deeper networks (ResNet-50+), use “bottleneck” layer to improve efficiency (similar to GoogLeNet)

# Case Study: ResNet

[He et al., 2015]

Training ResNet in practice:

- Batch Normalization after every CONV layer (next lecture)
- Xavier initialization from He et al. (next lecture)
- SGD + Momentum (next lecture)
- Learning rate: 0.1, divided by 10 when validation error plateaus
- Mini-batch size 256
- Weight decay of 1e-5
- No dropout used

# Case Study: ResNet

[He et al., 2015]

## Experimental Results

- Able to train very deep networks without degrading (152 layers on ImageNet, 1202 on Cifar)
- Deeper networks now achieve lower training error as expected
- Swept 1st place in all ILSVRC and COCO 2015 competitions

### MSRA @ ILSVRC & COCO 2015 Competitions

- **1st places** in all five main tracks
  - ImageNet Classification: “Ultra-deep” (quote Yann) **152-layer** nets
  - ImageNet Detection: **16%** better than 2nd
  - ImageNet Localization: **27%** better than 2nd
  - COCO Detection: **11%** better than 2nd
  - COCO Segmentation: **12%** better than 2nd

## “Good Practices for Deep Feature Fusion”

[Shao et al. 2016]

- Multi-scale ensembling of Inception, Inception-Resnet, Resnet, Wide Resnet models
- ILSVRC'16 classification winner

	Inception-v3	Inception-v4	Inception-Resnet-v2	Resnet-200	Wrn-68-3	Fusion (Val.)	Fusion (Test)
Err. (%)	4.20	4.01	3.52	4.26	4.65	2.92 (-0.6)	2.99

# ImageNet Large Scale Visual Recognition Challenge (ILSVRC) winners

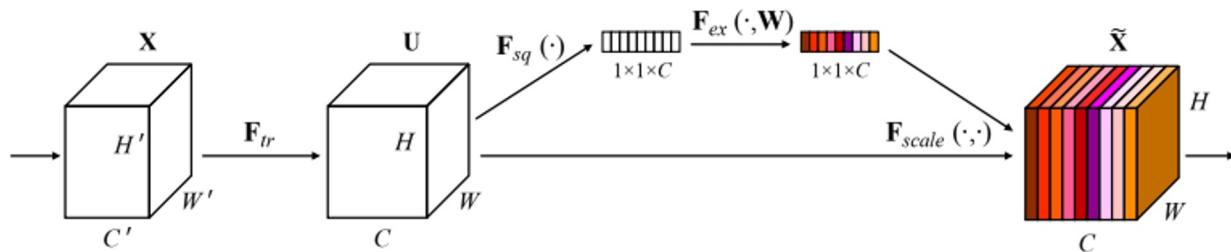

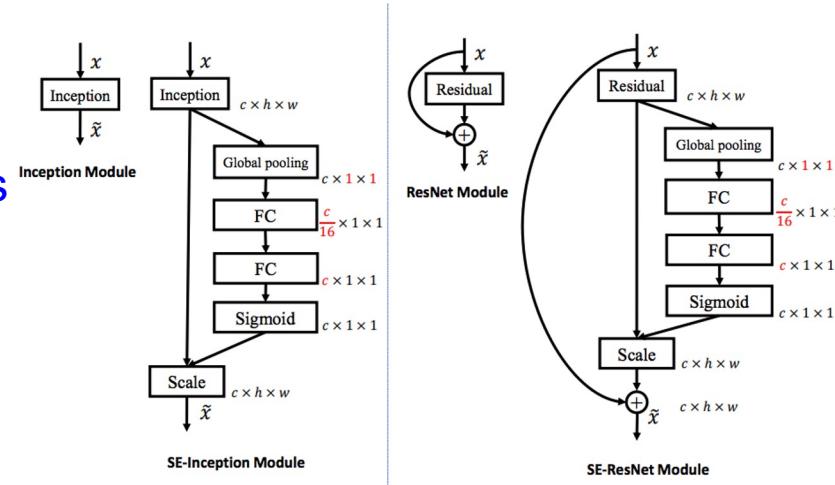

# Improving ResNets...

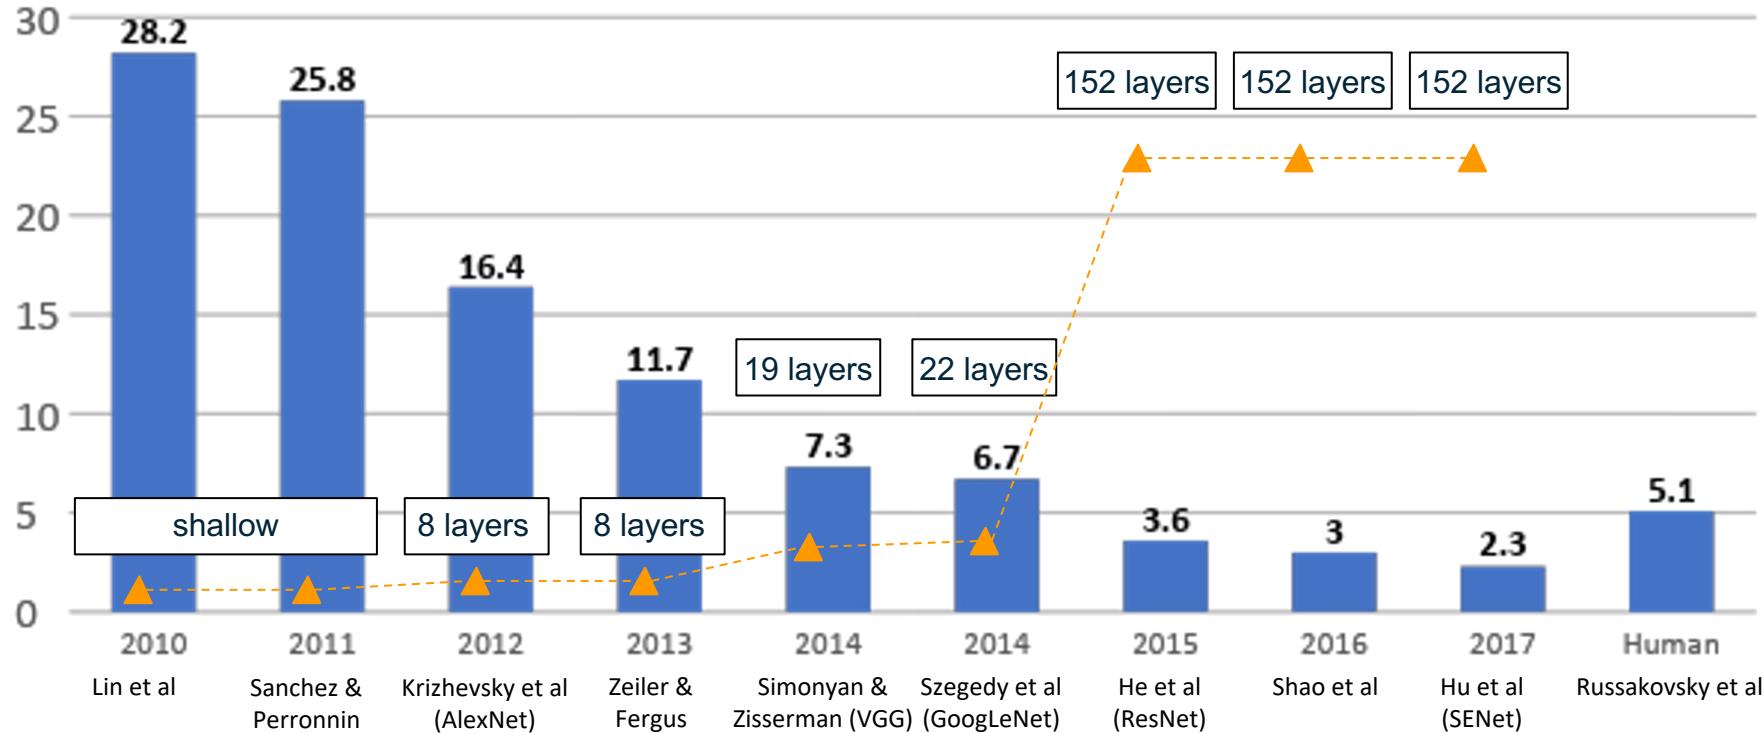

## Squeeze-and-Excitation Networks (SENet)

[Hu et al. 2017]

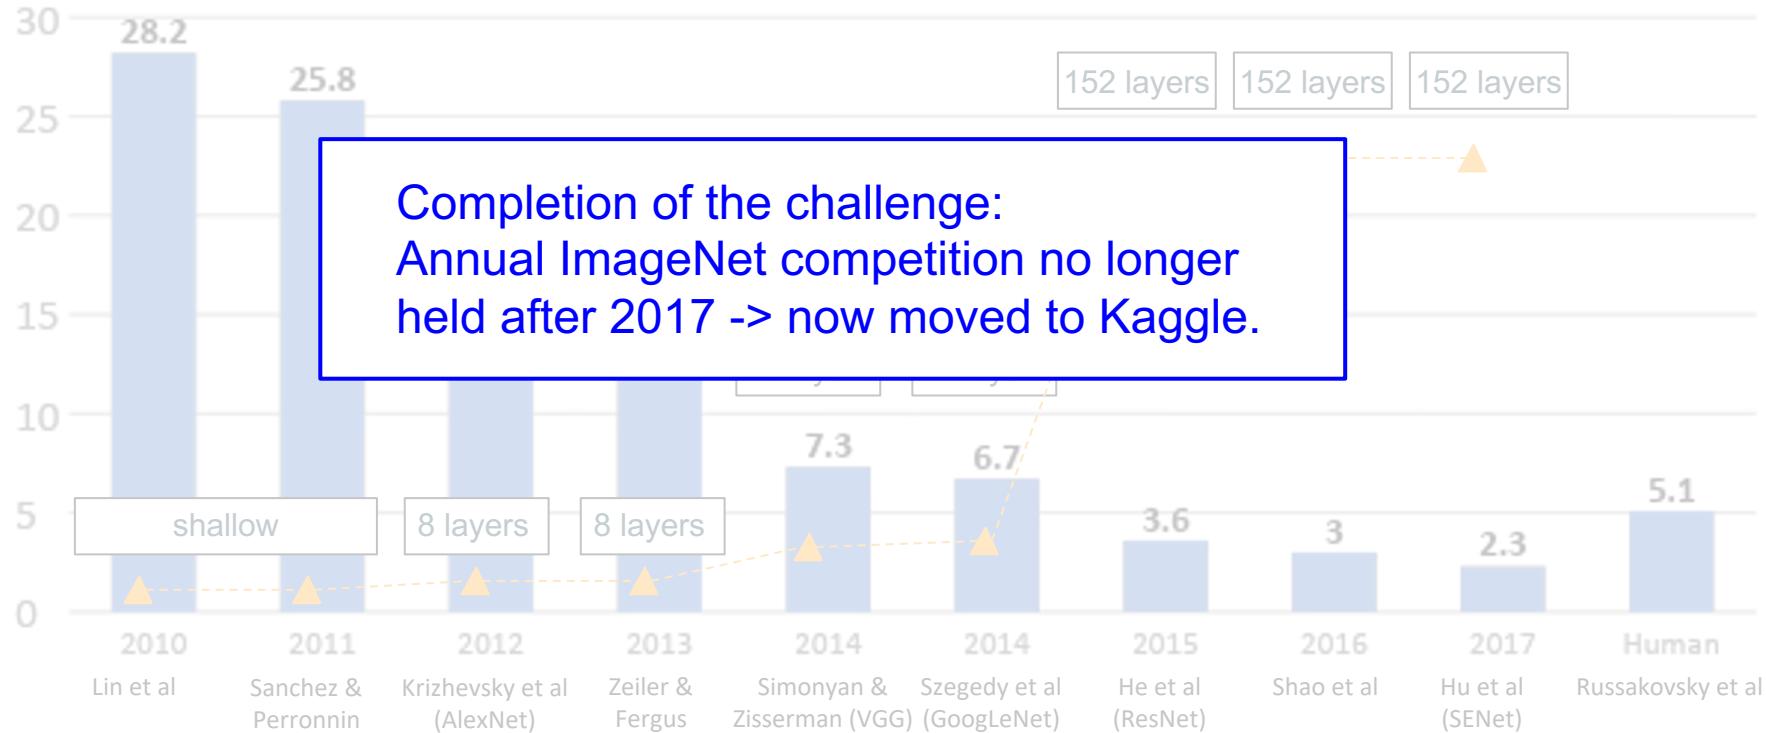

- Add a “feature recalibration” module that learns to adaptively reweight feature maps
- Global information (global avg. pooling layer) + 2 FC layers used to determine feature map weights
- ILSVRC’17 classification winner (using ResNeXt-152 as a base architecture)

# ImageNet Large Scale Visual Recognition Challenge (ILSVRC) winners

# ImageNet Large Scale Visual Recognition Challenge (ILSVRC) winners

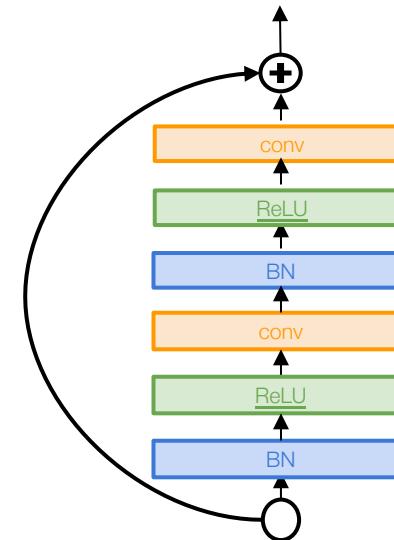

But research into CNN architectures is still flourishing

# Improving ResNets...

## Identity Mappings in Deep Residual Networks

[He et al. 2016]

- Improved ResNet block design from creators of ResNet
- Creates a more direct path for propagating information throughout network
- Gives better performance

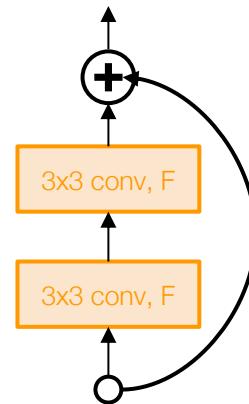

# Improving ResNets...

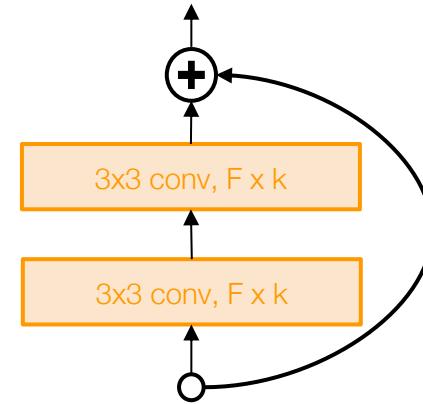

## Wide Residual Networks

[Zagoruyko et al. 2016]

- Argues that residuals are the important factor, not depth
- Use wider residual blocks ( $F \times k$  filters instead of  $F$  filters in each layer)
- 50-layer wide ResNet outperforms 152-layer original ResNet
- Increasing width instead of depth more computationally efficient (parallelizable)

Basic residual block

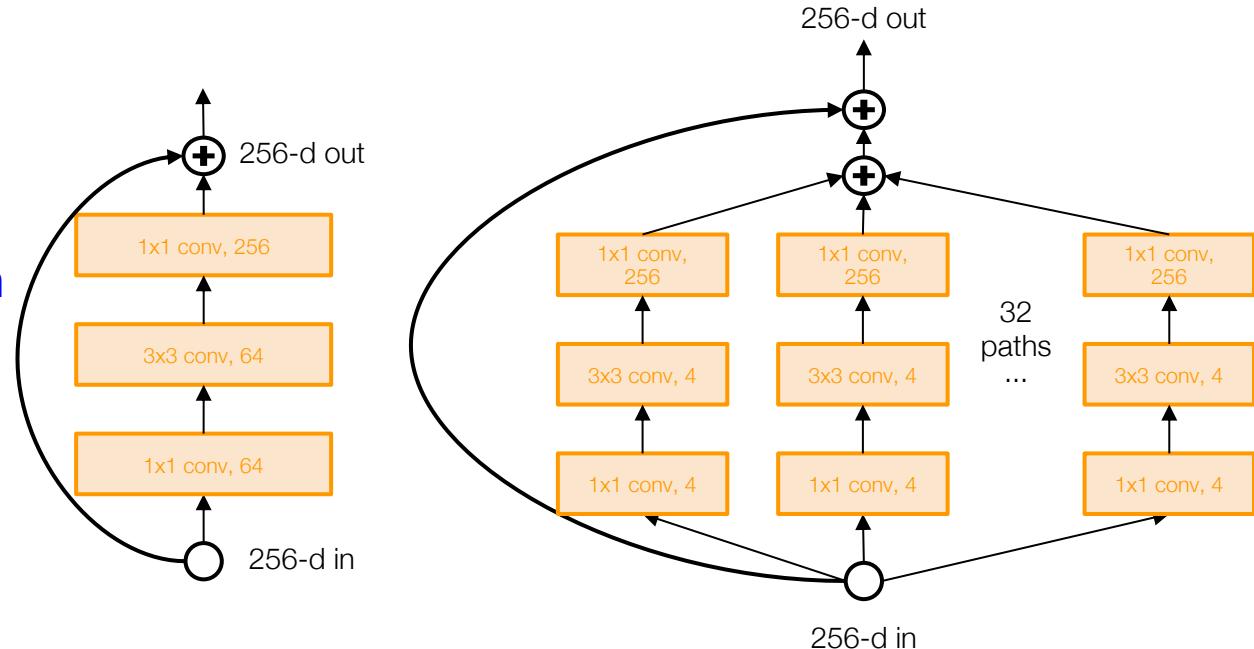

Wide residual block

# Improving ResNets...

# Aggregated Residual Transformations for Deep Neural Networks (ResNeXt)

[Xie et al. 2016]

- Also from creators of ResNet
- Increases width of residual block through multiple parallel pathways (“cardinality”)
- Parallel pathways similar in spirit to Inception module

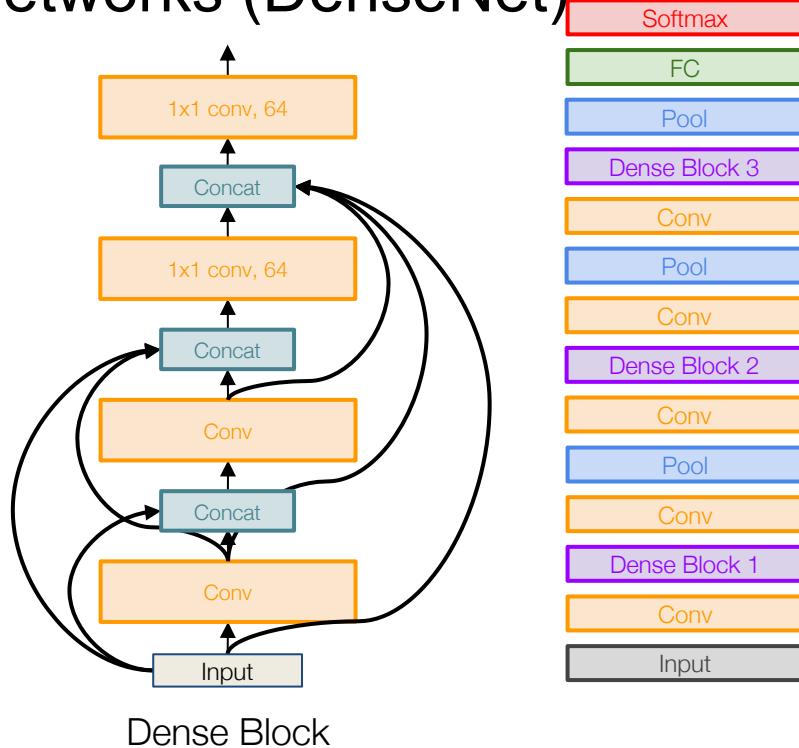

# Other ideas...

## Densely Connected Convolutional Networks (DenseNet)

[Huang et al. 2017]

- Dense blocks where each layer is connected to every other layer in feedforward fashion
- Alleviates vanishing gradient, strengthens feature propagation, encourages feature reuse
- Showed that shallow 50-layer network can outperform deeper 152 layer ResNet

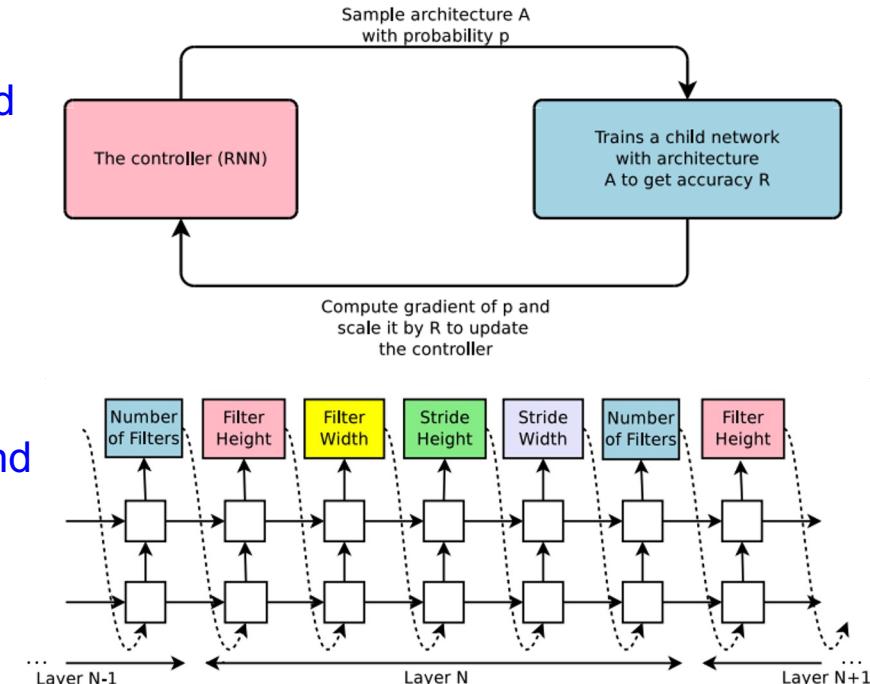

# Learning to search for network architectures...

## Neural Architecture Search with Reinforcement Learning (NAS)

[Zoph et al. 2016]

- “Controller” network that learns to design a good network architecture (output a string corresponding to network design)
- Iterate:
  - 1) Sample an architecture from search space
  - 2) Train the architecture to get a “reward”  $R$  corresponding to accuracy
  - 3) Compute gradient of sample probability, and scale by  $R$  to perform controller parameter update (i.e. increase likelihood of good architecture being sampled, decrease likelihood of bad architecture)

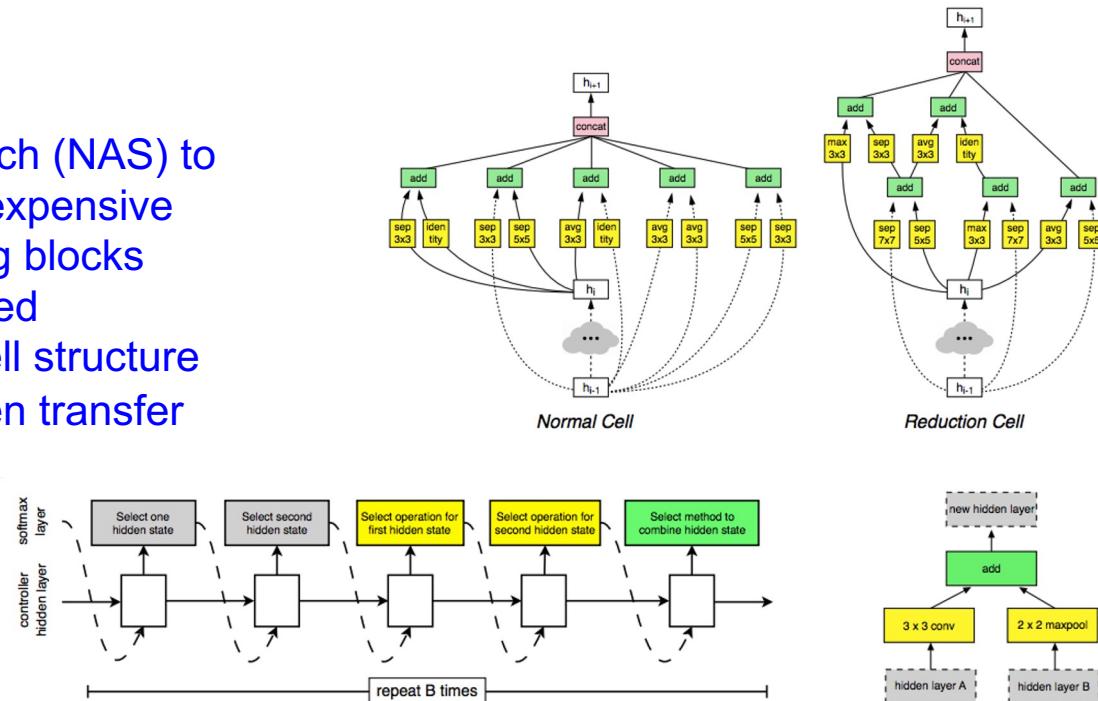

# Learning to search for network architectures...

## Learning Transferable Architectures for Scalable Image Recognition

[Zoph et al. 2017]

- Applying neural architecture search (NAS) to a large dataset like ImageNet is expensive
- Design a search space of building blocks (“cells”) that can be flexibly stacked
- NASNet: Use NAS to find best cell structure on smaller CIFAR-10 dataset, then transfer architecture to ImageNet
- Many follow-up works in this space e.g. AmoebaNet (Real et al. 2019) and ENAS (Pham, Guan et al. 2018)

# But sometimes smart heuristic is better than NAS ...

## EfficientNet: Smart Compound Scaling

[Tan and Le. 2019]

- Increase network capacity by scaling width, depth, and resolution, while balancing accuracy and efficiency.
- Search for optimal set of compound scaling factors given a compute budget (target memory & flops).
- Scale up using smart heuristic rules

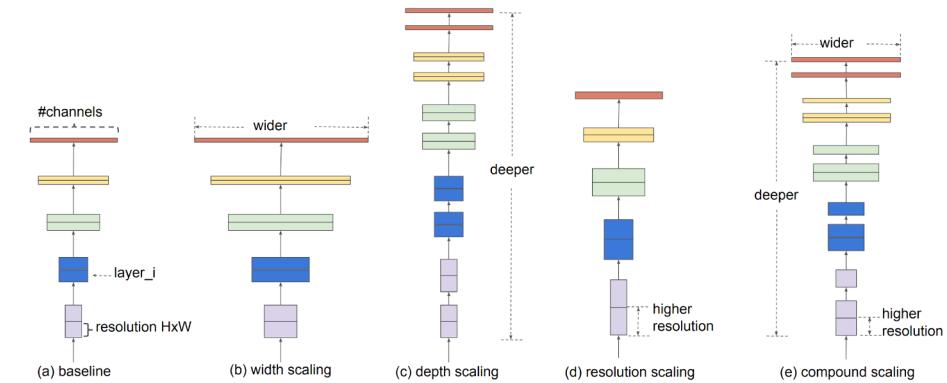

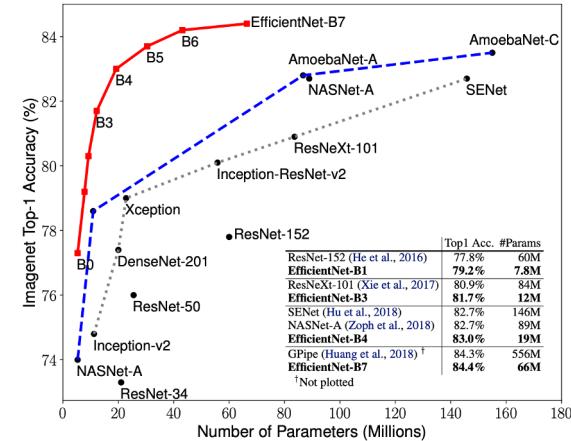

$$\text{depth: } d = \alpha^\phi$$

$$\text{width: } w = \beta^\phi$$

$$\text{resolution: } r = \gamma^\phi$$

$$\text{s.t. } \alpha \cdot \beta^2 \cdot \gamma^2 \approx 2$$

$$\alpha \geq 1, \beta \geq 1, \gamma \geq 1$$
