
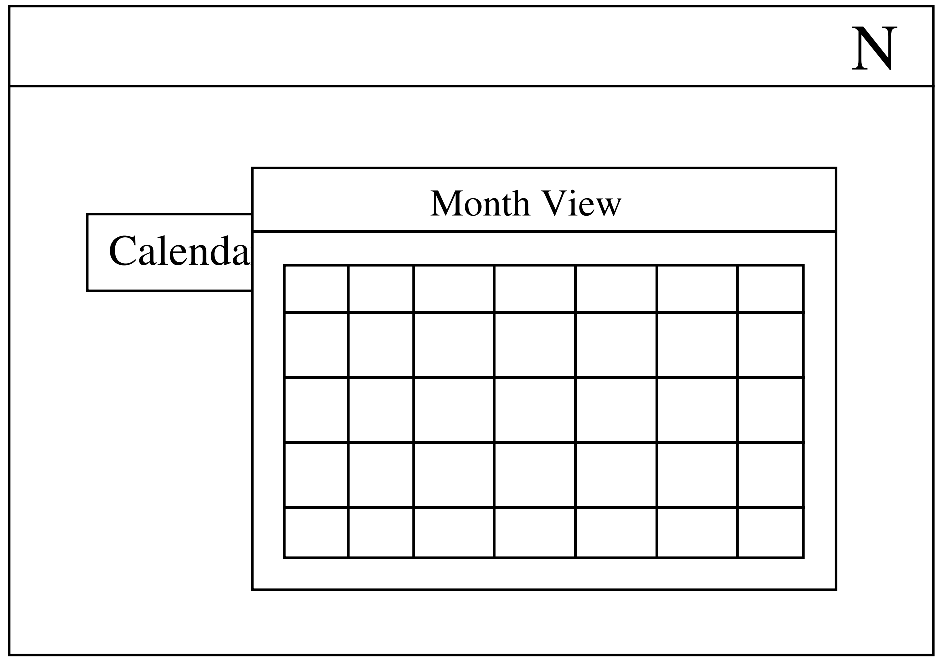
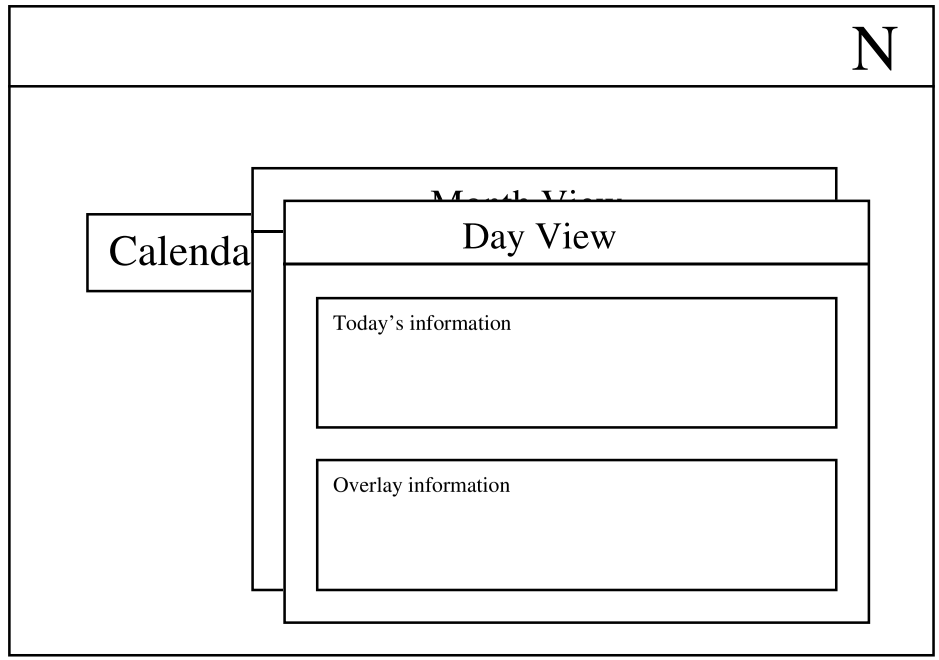
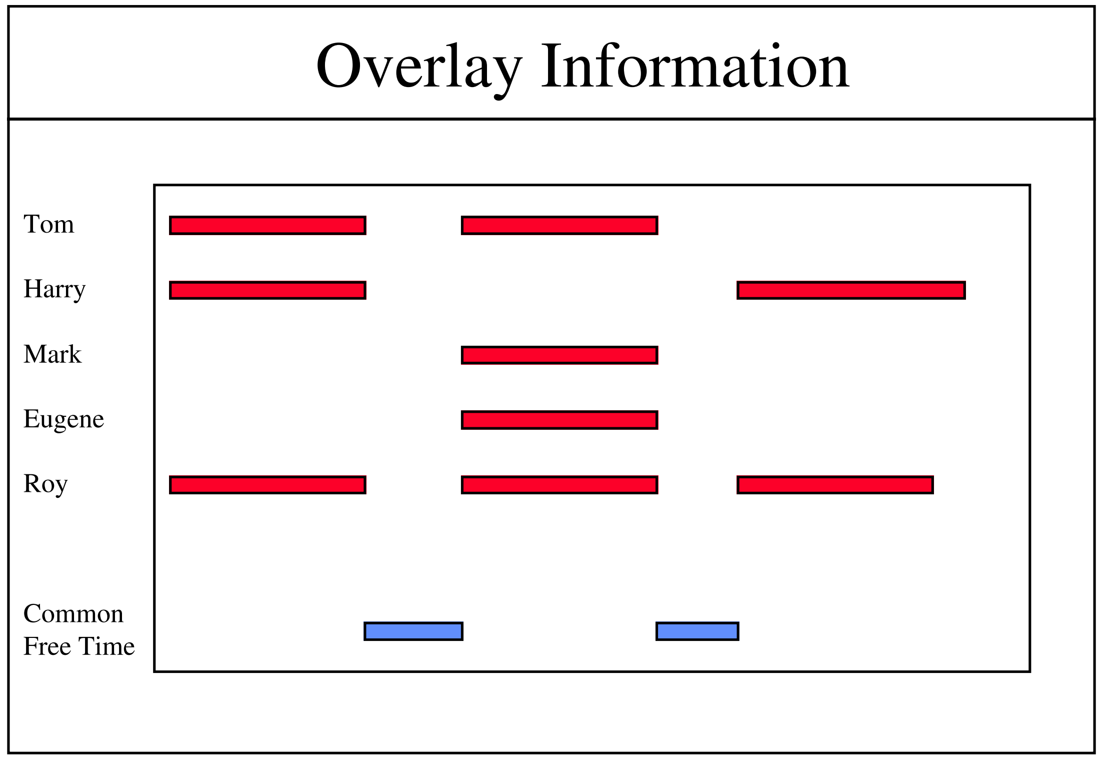
1) User clicks on calendar applet from www page.



1) Host page sends applet. Datahandler loads and requests data from host. Applet spawns month view window and places info in it.



1) User clicks on a day in the Month View. A day view spawns on that day. The info handler querys the group dayplan files for group information. The dayview updates this information.



This is a close-up of the overlay information
presented on the day view.
