# Maximizers (5)

The screenshot displays the Microsoft Development Environment (MDE) interface. The main window shows the source code for `calFeatures.cs`. The code is as follows:

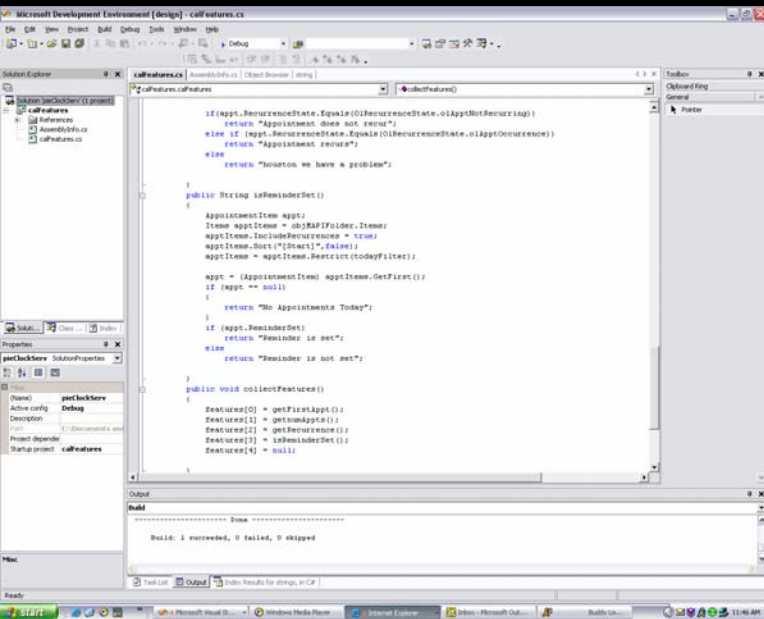

```
if (appt.RecurrenceState.Equals(01RecurrenceState.01ApptNotRecurring))
    return "Appointment does not recur";
else if (appt.RecurrenceState.Equals(01RecurrenceState.01ApptOccurrence))
    return "Appointment recurs";
else
    return "houston we have a problem";
}

public String isReminderSet()
{
    AppointmentItem appt;
    Items apptItems = objMAPIFolder.Items;
    apptItems.IncludeRecurrences = true;
    apptItems.Sort("[Start]", false);
    apptItems = apptItems.Restrict(todayFilter);

    appt = (AppointmentItem) apptItems.GetFirst();
    if (appt == null)
    {
        return "No Appointments Today";
    }
    if (appt.ReminderSet)
        return "Reminder is set";
    else
        return "Reminder is not set";
}

public void collectFeatures()
{
    features[0] = getFirstAppt();
    features[1] = getnumAppts();
    features[2] = getRecurrence();
    features[3] = isReminderSet();
    features[4] = null;
}
```

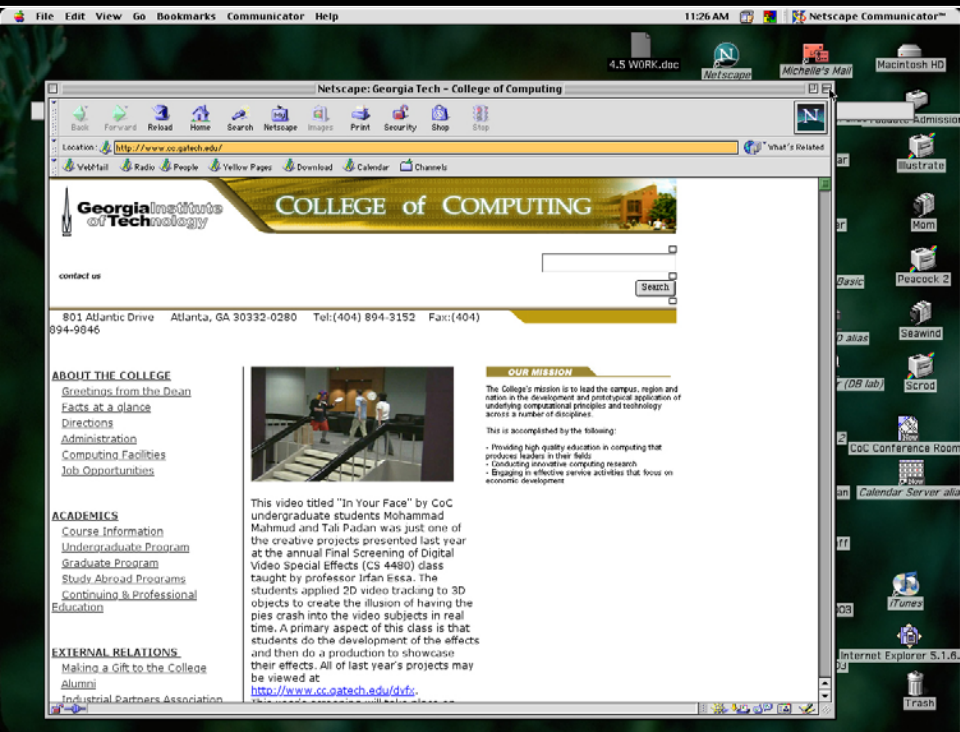

The Solution Explorer on the left shows the project structure for `pieClockServ`, including `References`, `AssemblyInfo.cs`, and `calFeatures.cs`. The Properties window below it shows the project name `pieClockServ` and the active configuration `Debug`. The Output window at the bottom shows the build result: `Build: 1 succeeded, 0 failed, 0 skipped`. The Windows taskbar at the bottom shows the system tray with the time `11:46 AM`.

management styles and correlations to system types. Findings indicate the many facets of space management and can help designers and evaluators build for emerging display and interaction technologies.

**Author Keywords**  
interview, window management, space management, multiple monitors, multiple desktops

**ACM Classification Keywords**  
H.5.2 User Interfaces: Evaluation/Methodology, GUI, Windowing Systems

**INTRODUCTION**  
The personal computer (PC) has undergone dramatic changes over the past 25 years. The huge gains in processor speed and physical memory and the popularity of the Internet have allowed people to use computers in an astonishing variety of ways. Throughout this period, the desktop, and its related window system, have changed very little. Many organizations and individuals have built a variety of window managers and interaction techniques to help users allocate space to windows and information, but few have been formally evaluated. Furthermore, because of a very small number of studies of the actual practices of

meaning that similar displays will start be used as we move forward. This situation creates an interesting challenge for emerging space managers: the ability to effectively manage a large display space while still being relevant to the small display areas that have dominated interaction. Having a thorough understanding of space management practices will also help the transition to fledgling input technologies such as voice recognition, eye-gaze tracking, and even brain-based communication, all of which have the potential to become everyday interaction methods.

In this paper we present results from a study of 20 users of various window managers and display configurations. After discussing related work, the details of the study, and some definitions, we give a classification of our participants' management styles. The majority of this paper examines the general management principles discovered in the interviews, with implications for design and evaluation shown for each principle. Finally, we suggest directions for future work in space management.

**RELATED WORK**  
The idea of understanding and evaluating window management practices is certainly not new, Gaylin [6] and Bly and Rosenberg [3] are examples of each, respectively. Beyond these works from 1986 however, recent work tends to focus on particular types of displays, not general practices. Grudin studies multiple-monitor users [7] and Ringel compares them to multiple-desktop users [14]. Mynatt [12] and Perry and O'Hara [13] use interviews and

ABOUT THE COLLEGE

- Greetings from the Dean
Facts at a glance
Directions
Administration
Computing Facilities
Job Opportunities

This video titled "In Your Face" by CoC undergraduate students Mohammad Mahmud and Tali Padan was just one of the creative projects presented last year at the annual Final Screening of Digital Video Special Effects (CS 4480) class taught by professor Irfan Essa. The students applied 2D video tracking to 3D objects to create the illusion of having the pies crash into the video subjects in real time. A primary aspect of this class is that students do the development of the effects and then do a production to showcase their effects. All of last year's projects may be viewed at http://www.cc.gatech.edu/dvfx.

OUR MISSION

The College's mission is to lead the campus, region and nation in the development and prototypical application of underlying computational principles and technology across a number of disciplines.

This is accomplished by the following:

- Providing high quality education in computing that produces leaders in their fields
- Conducting innovative computing research
- Engaging in effective service activities that focus on economic development

ACADEMICS

- Course Information
Undergraduate Program
Graduate Program
Study Abroad Programs
Continuing & Professional Education

EXTERNAL RELATIONS

- Making a Gift to the College
Alumni
Industrial Partners Association
